

# **iPhone App Dev**

## **Lesson 2**

# Practice

- Browse the App Store. Find some apps that impress you. Discuss why they are good.
- Do you have any problem that want to solve in a mobile phone? What app do you want to develop?

# Summary

- Introducing Objective-C
- NSString and tracing log message
- Using UILabel
- Application Life Cycle
- Delegation
- Using UITextField
- Using UIButton
- Detecting Touches

# Objective-C

# Introducing Obj-C

- Obj-C is a super set of C
- We can use C stuff, such as primitive type

```
1 int a = 12;
2 int b = 100;
3 int c = a+b; // we have c = 112.
4 a=10;
5 int d = a+b; // we have d = 110.
```

# Data is Dumb

- Data is not smart.
- Data does not have any ability.
- Data is manipulated and transformed and it is still dumb data.

For example, given a number variable 13. This data itself doesn't know the next integer.

# Function is not smart

- Function take input data and calculate the output data.
- Function does not care about the data.
- Function has no relationship with data.
- Function and Data encourage Procedural Programming

# Object is smart

- Object contains both data and function, which we call it method.
- We define behavior of object.
- Methods have strong relationship with data inside the object.
- We can think in higher level to tackle the problem.

# Class and Instance

- Class is prototype of a kind of Object.
- Class is like a factory object. We build objects based on the factory setting.

# Class and Instance

- Instance is the object built from the factory, Class.
- We cannot create object instance without a class.
- Each object instance has the same data and methods as defined in its Class.

# Obj-C Class

- Objective-C Class contains both Interface and Implementation.
- Interface is usually named .h file
- Implementation is usually named .m file
- Obj-C++ implementation is named .mm

# Interface

- An example of Obj-C interface

```
1 #import <UIKit/UIKit.h>
2
3
4
5 @interface MainController : NSObject
6
7 - (void)touchesBegan:(NSSet *)touches withEvent:(UIEvent *)event;
8
9 - (void)touchesMoved:(NSSet *)touches withEvent:(UIEvent *)event;
10
11 - (void)touchesEnded:(NSSet *)touches withEvent:(UIEvent *)event;
12
13 - (void)sayHello;
14
15 @end
```

# Example

```
MainViewController *controller = [[MainViewController alloc] init];  
[controller sayHello];
```

# Message Passing

```
1 @interface Person : NSObject
2 - (void) sayMessage: (NSString*) msg to: (NSString*) target;
3 @end
4
5
6 Person *person = [[Person alloc] init];
7 [person sayMessage:@"hello" to:@"Thomas"];
```

# **NSString**

# NSLog - Log Message

- NSLog takes a NSString format argument.  
So we can log a text in console with

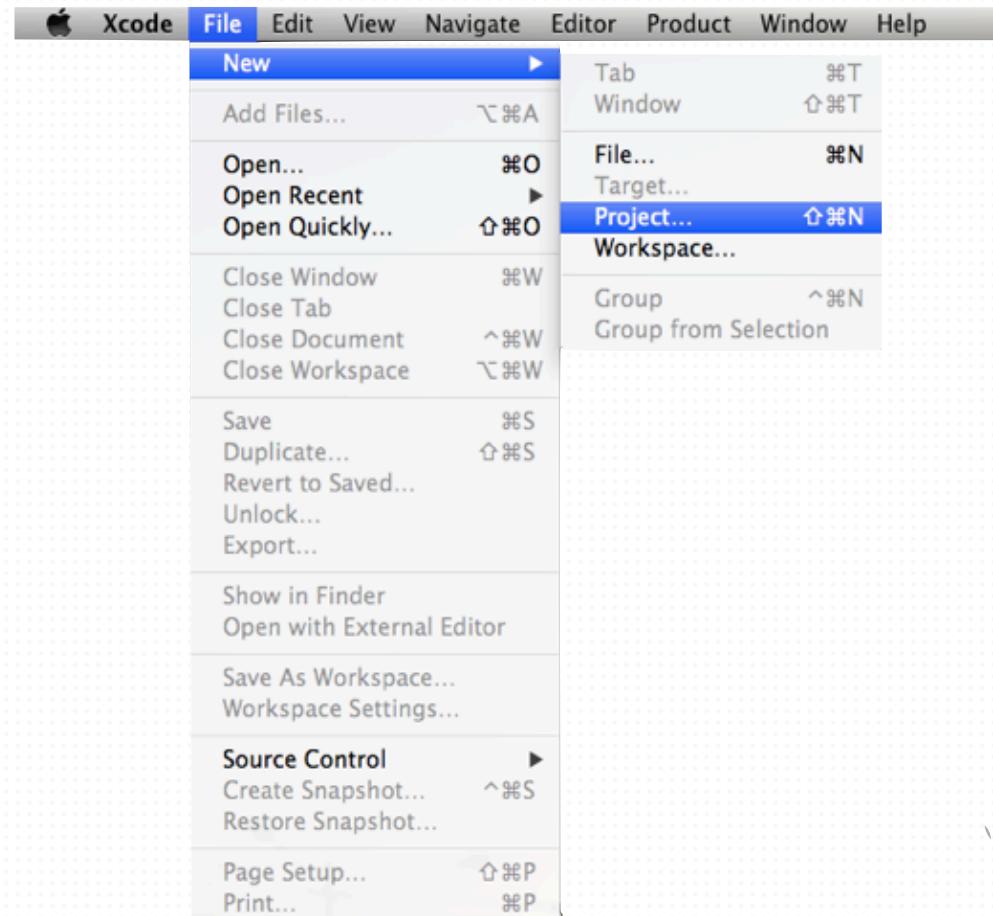

```
1 NSLog(@"hello world");
2 // output "hello world"
3
4 NSLog(@"this is a number: %d", 123);
5 // output "this is a number: 123"
6
7 NSLog(@"%@", 1, 2, 3);
8 // output "1 + 2 = 3"
```

# NSLog - Log Message

- %d is decimal number.
  - %f is floating point number
  - %@ is a string description of an object
- 
- %02d means decimal with at least 2 digits.
  - %.2f means floating point with 2 decimal places.

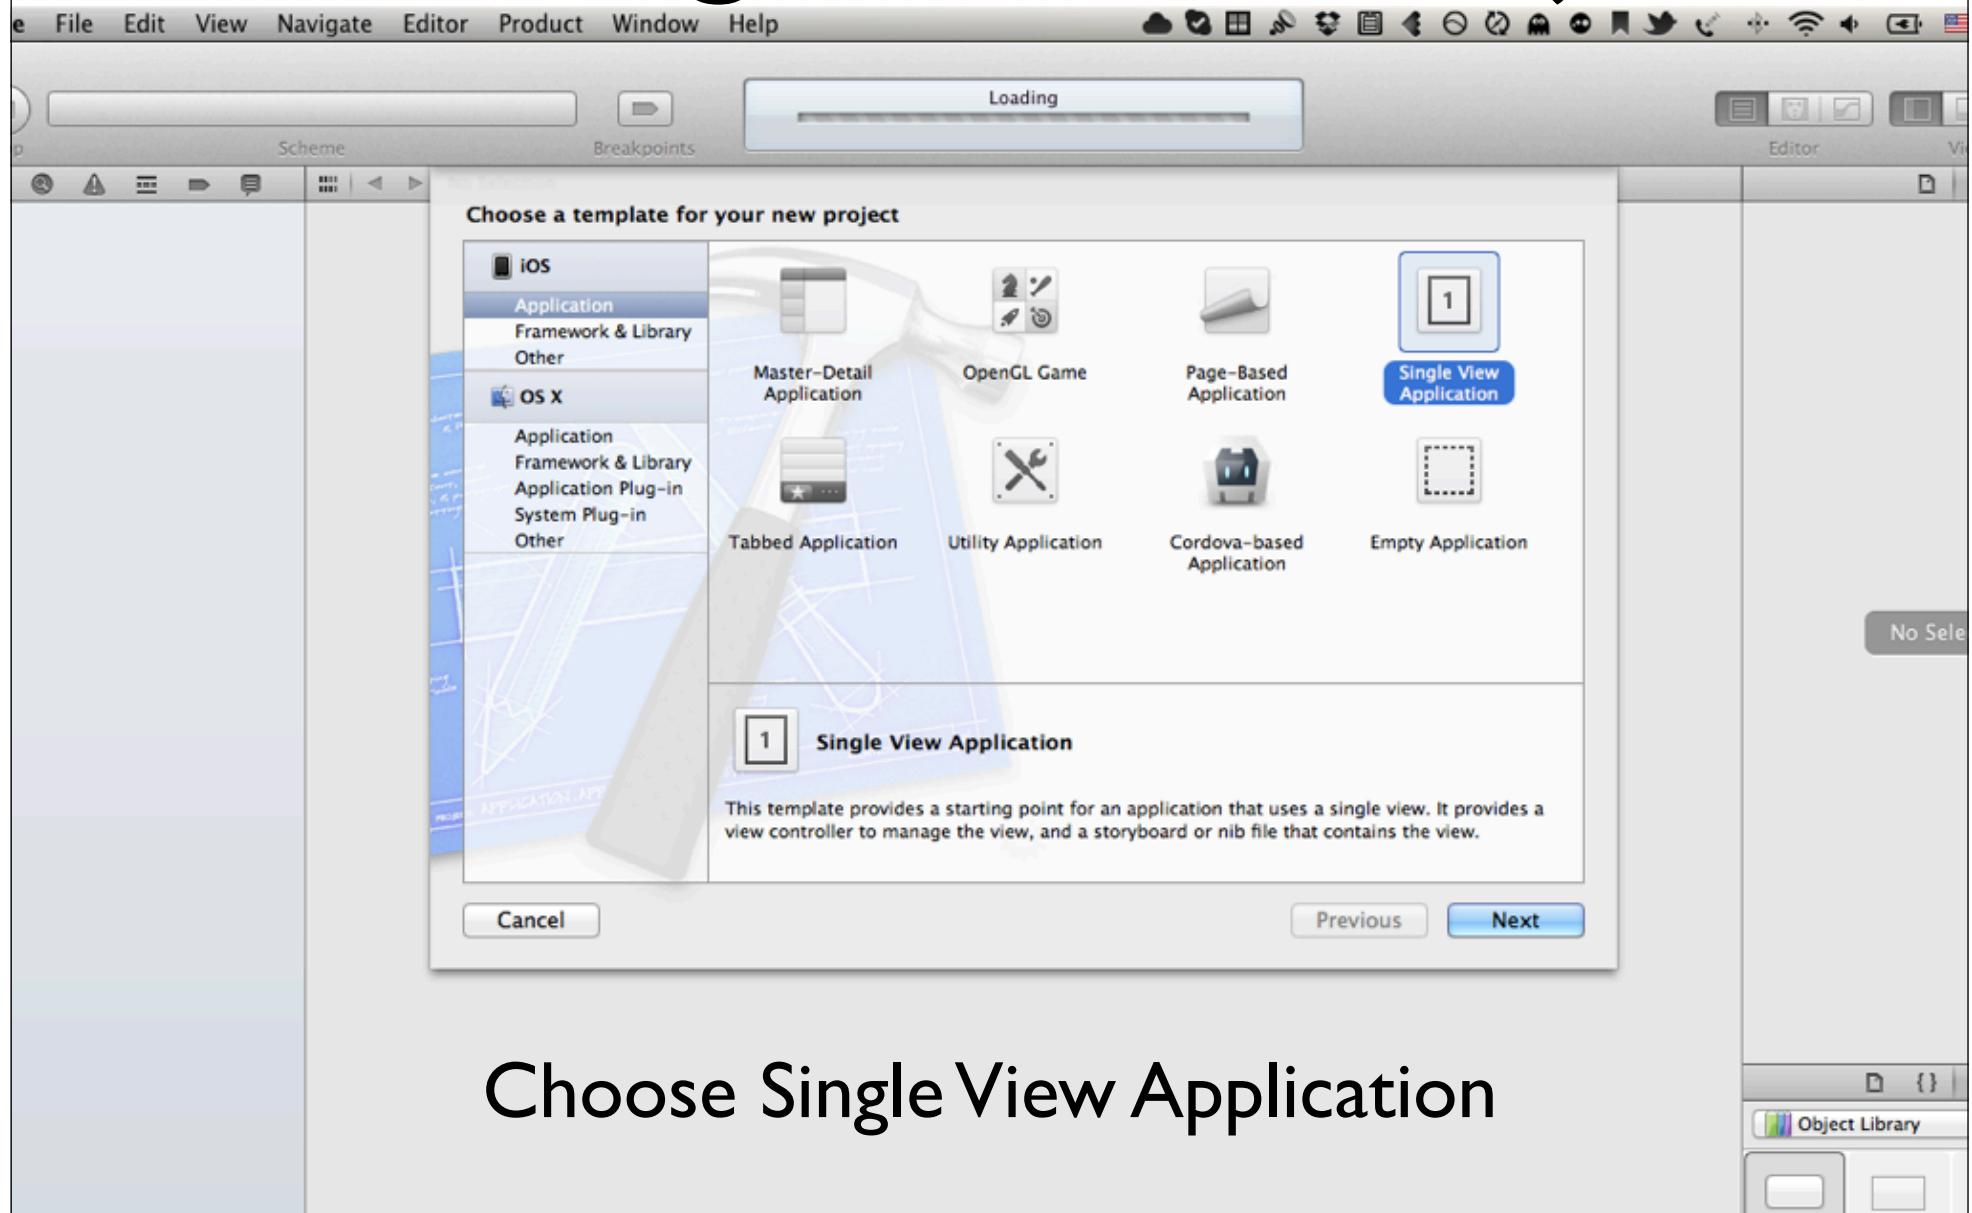

# Creating XCode Project

# Creating XCode Project

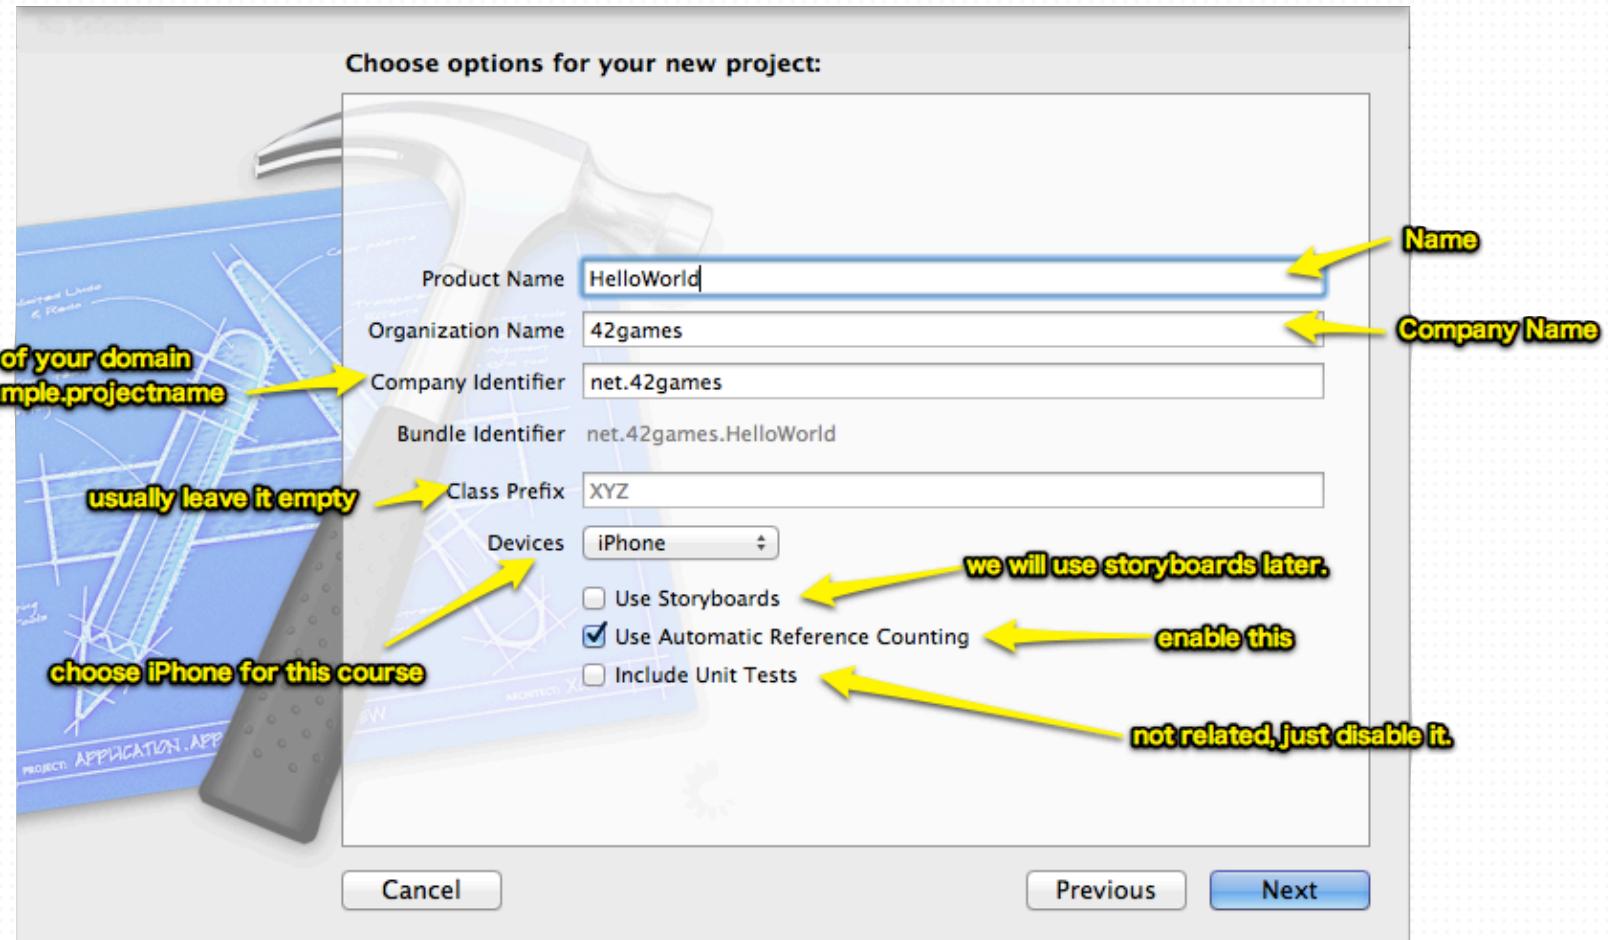

File | New | Project

# Creating XCode Project

Choose Single View Application

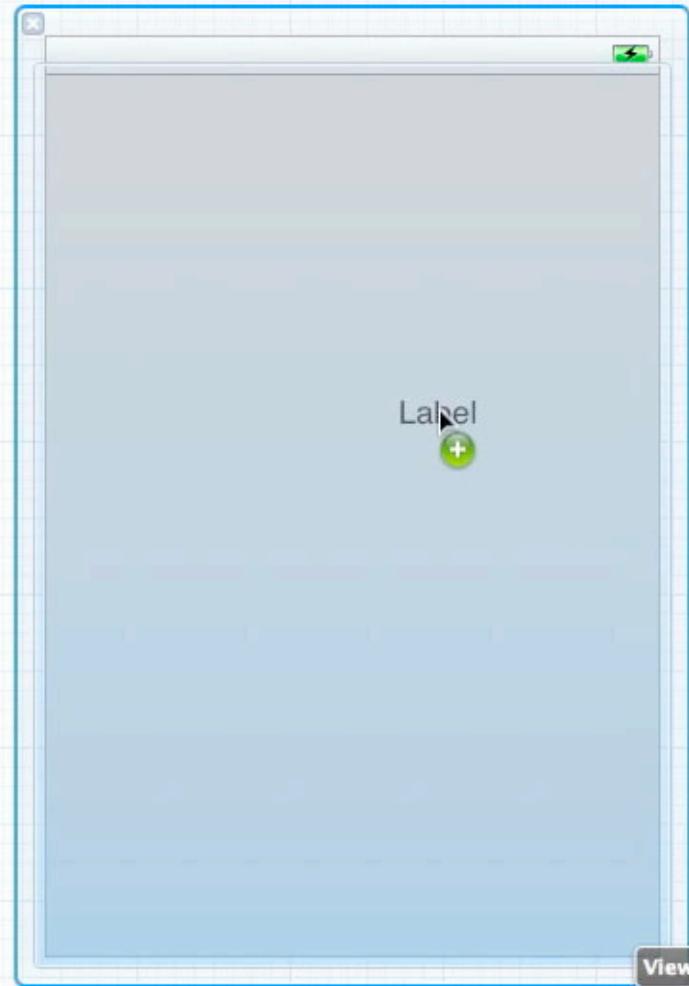

# Creating XCode Project

Choose Single View Application

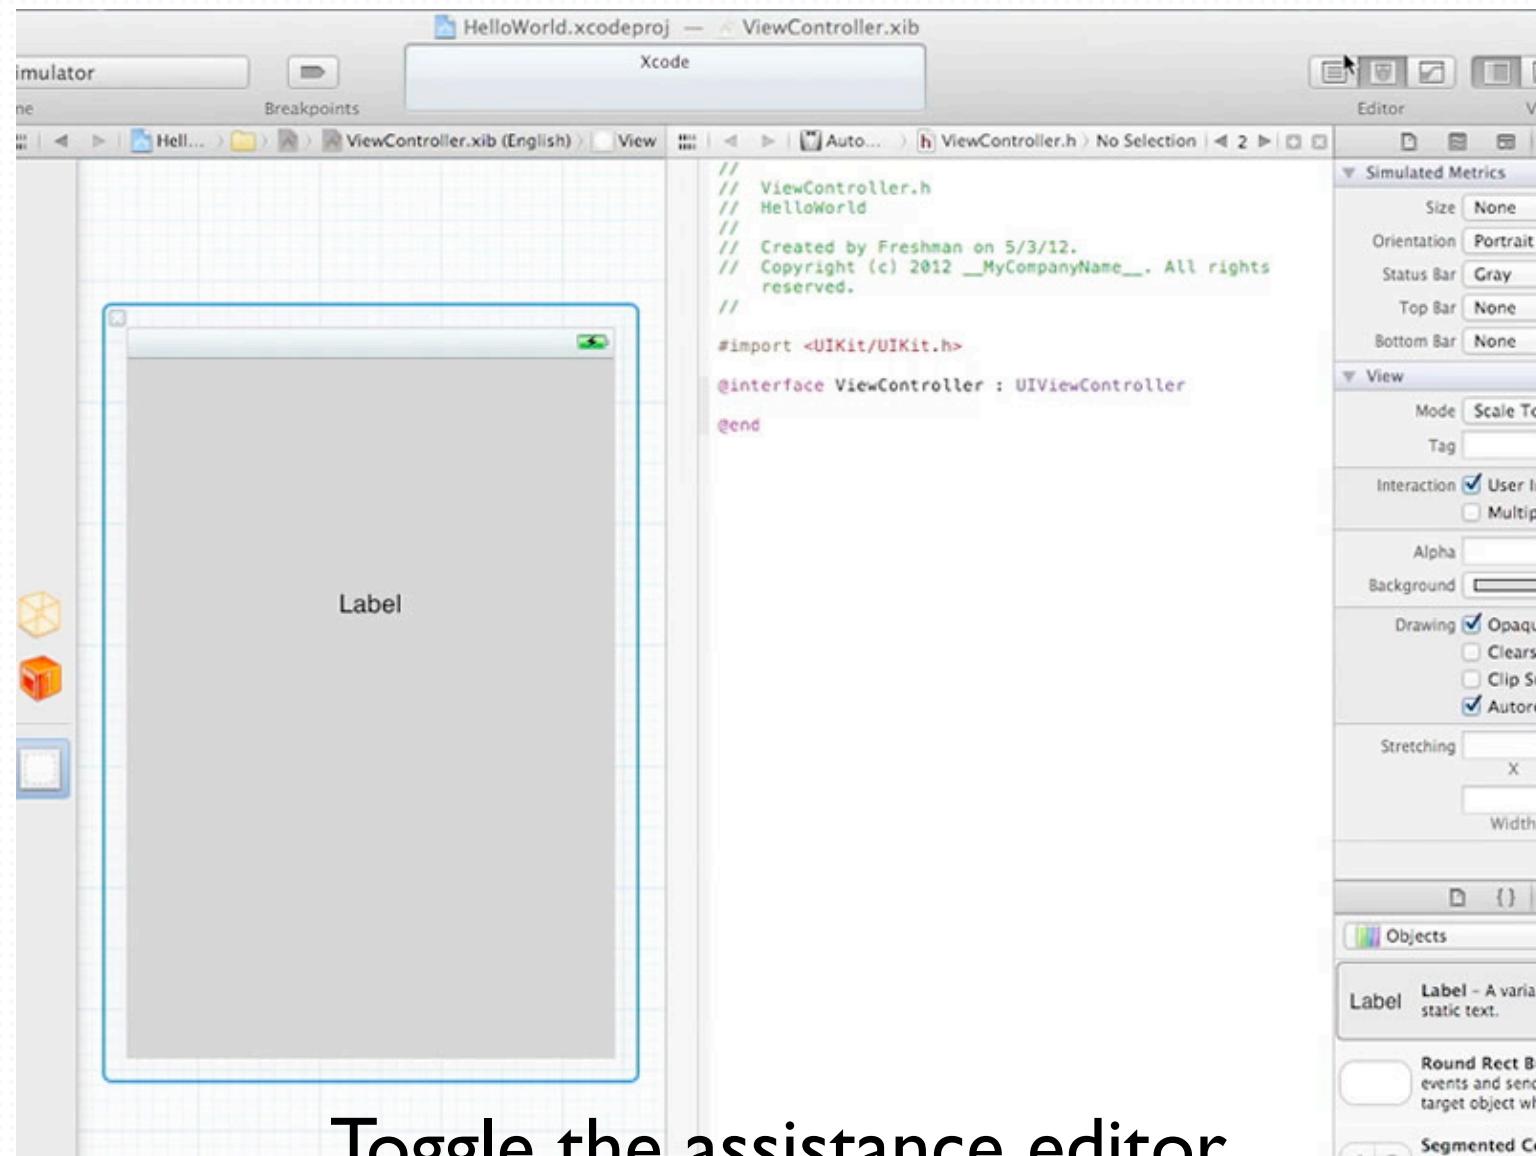

# Using UILabel

# Using UILabel

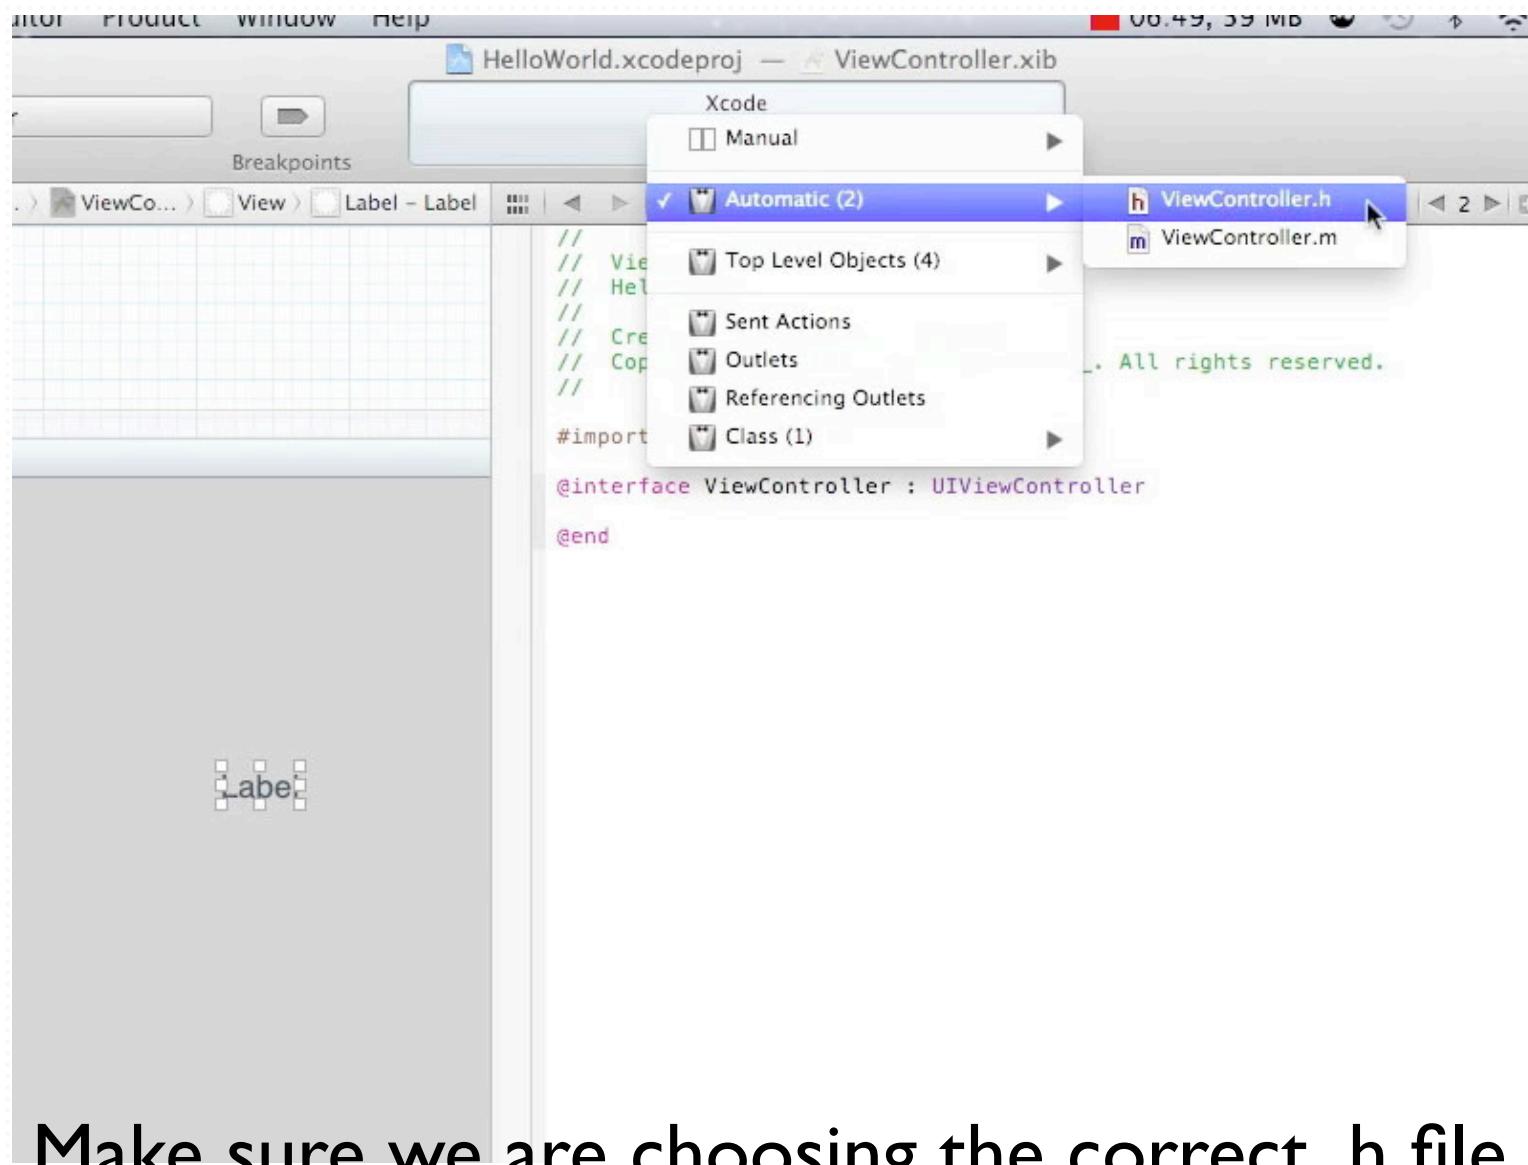

Dragging a Label into the view.

# Using UILabel

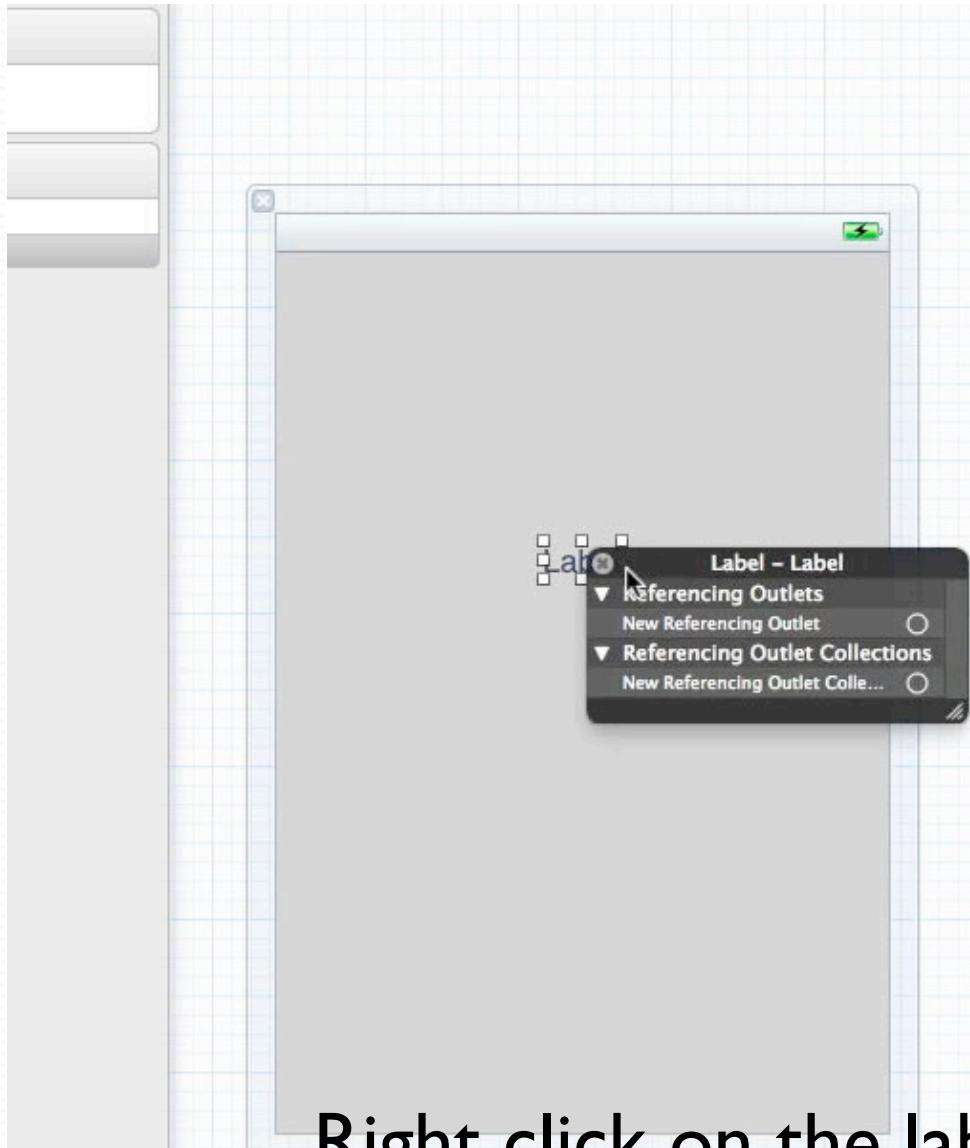

Toggle the assistance editor.

# Using UILabel

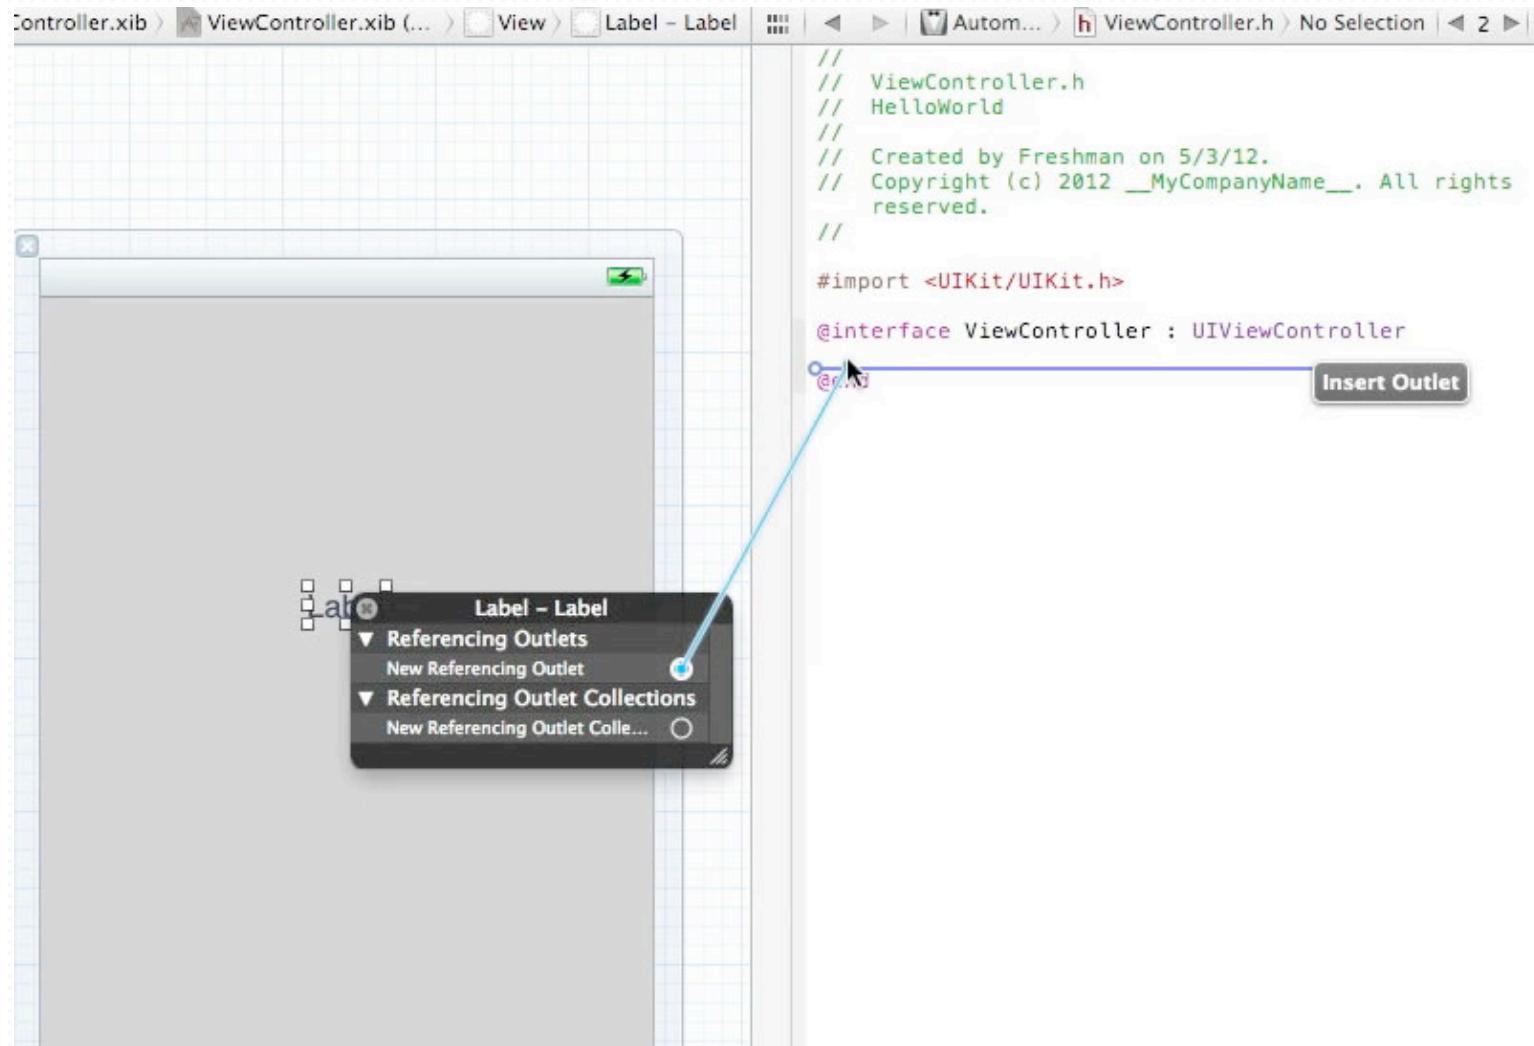

Make sure we are choosing the correct .h file.

# Using UILabel

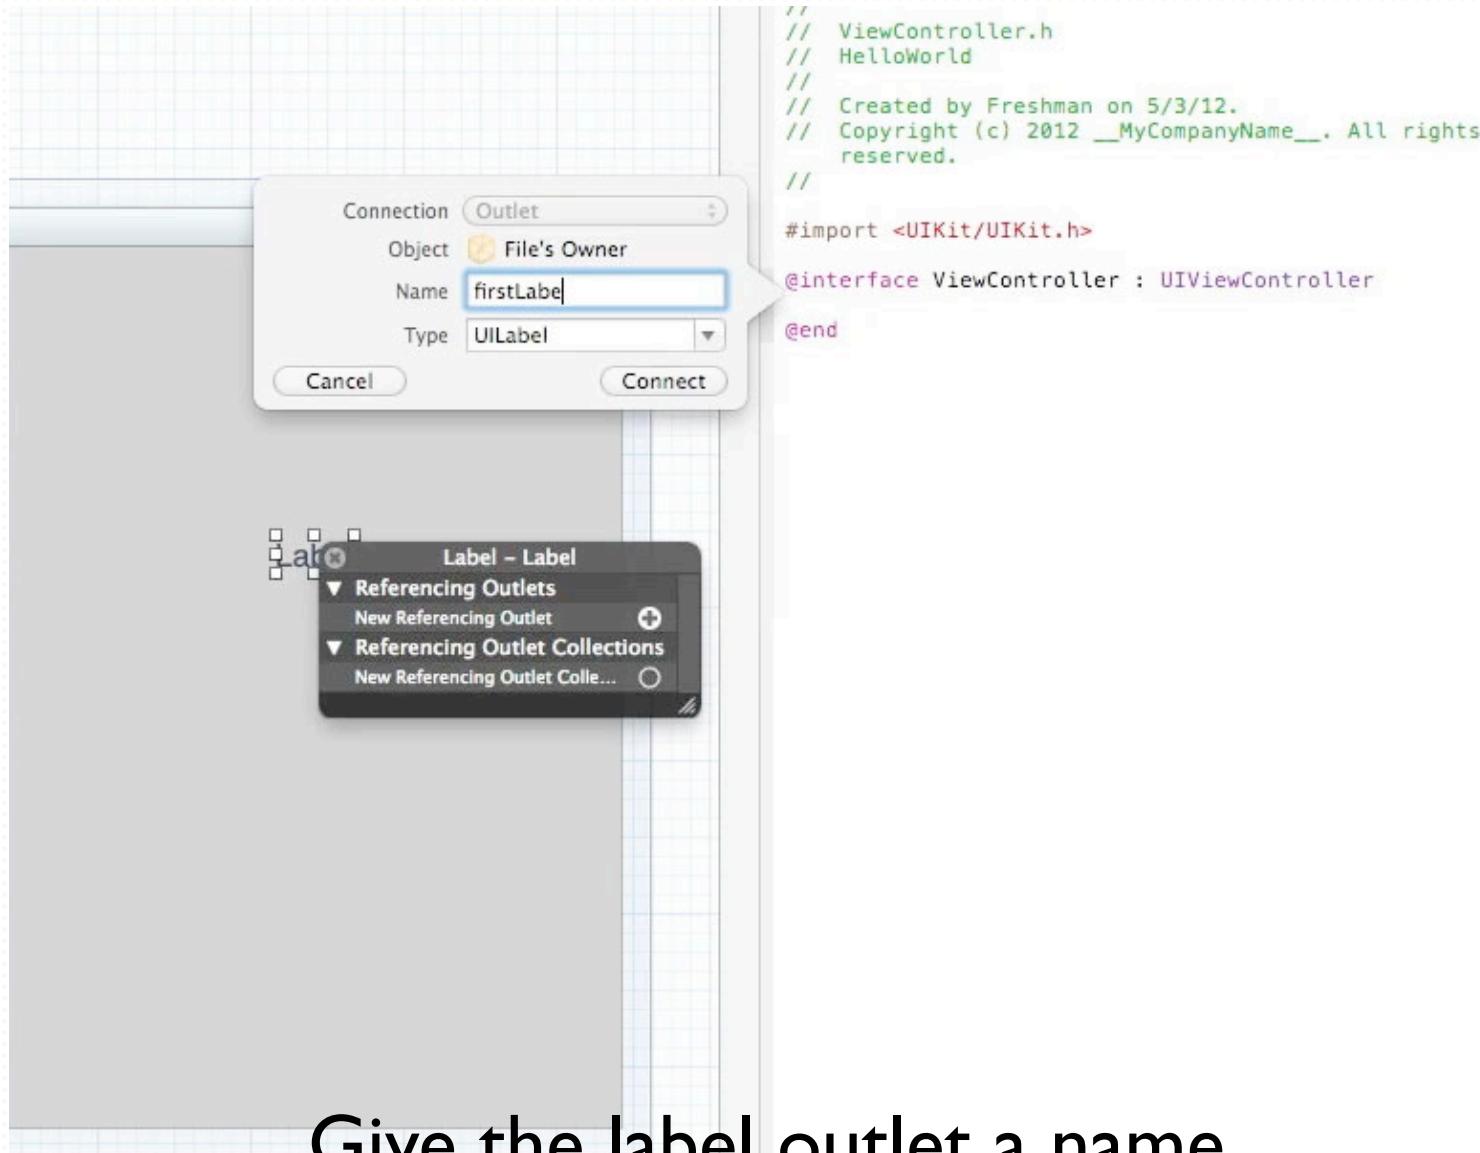

Right click on the label view.

# Using UILabel

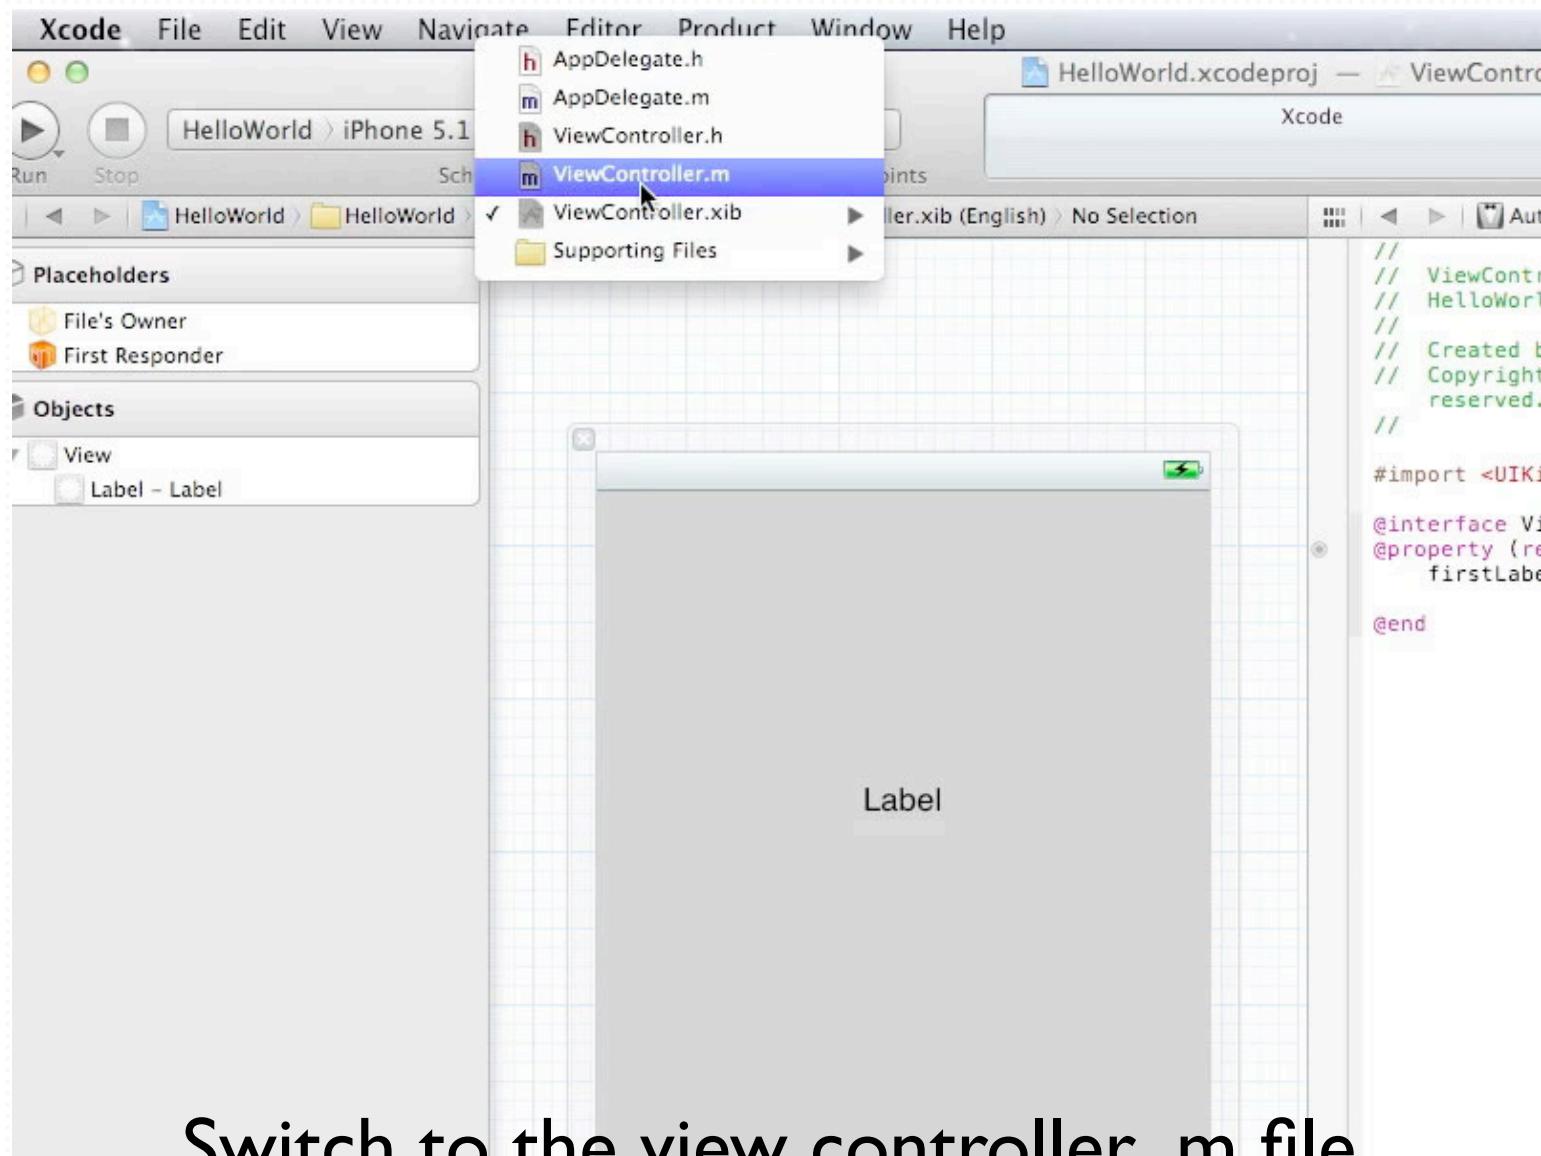

Drag the “New Referencing Outlet” to header.

# Using UILabel

Give the label outlet a name.

# Using UILabel

Switch to the view controller .m file.

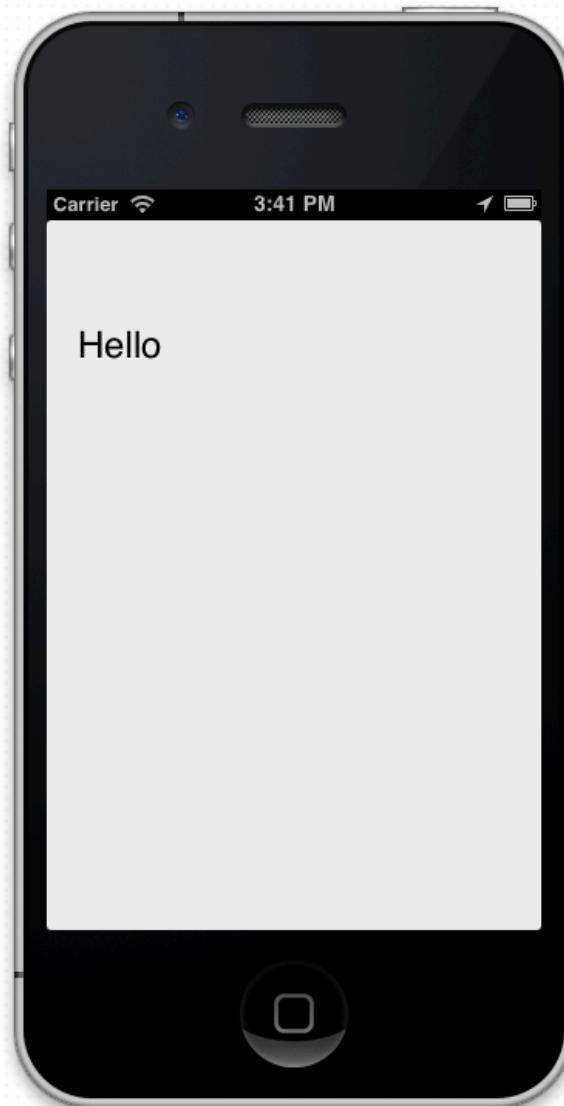

# Using UILabel

## Setting text label

```
@implementation ViewController  
  
- (void)viewDidLoad  
{  
    [super viewDidLoad];  
    // Do any additional setup after loading the view, typically from a nib.  
  
    self.firstLabel.text = @"Hello";  
}
```

Add the label text changing code in  
viewDidLoad delegate method

# Using UILabel

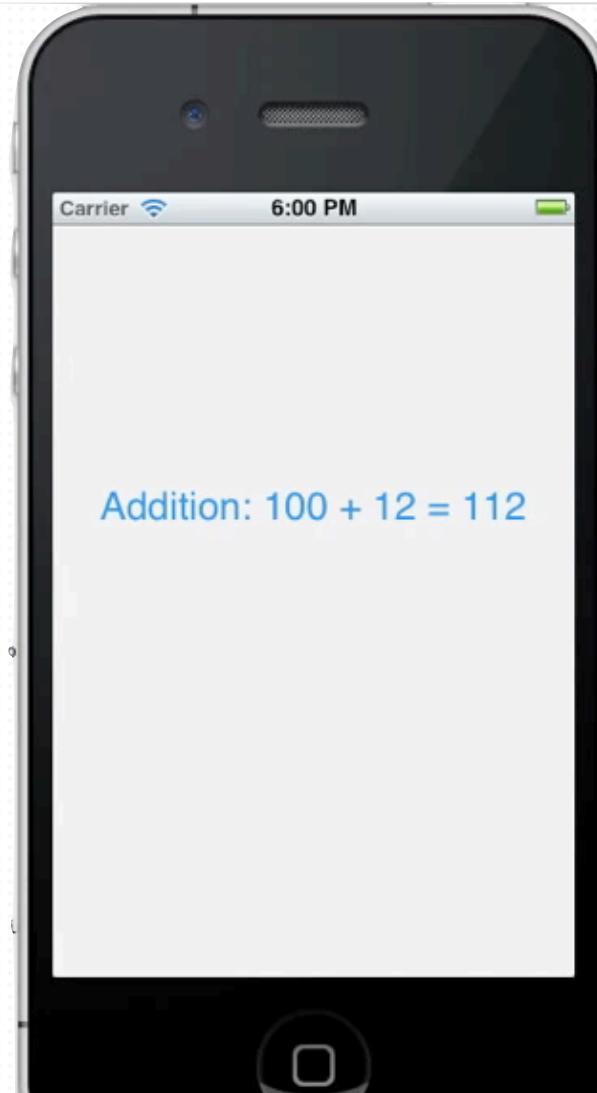

# Using UILabel

- Setting text label with string formatter

```
1 NSString *caption = @"Addition";
2
3 int a = 100;
4 int b = 12;
5 int c = a + b;
6
7 self.firstLabel.text = [NSString
stringWithFormat:@"%@: %d + %d = %d", caption, a, b, c];
```

# Using UILabel

# Using UILabel

- **Setting text color**

```
1 self.firstLabel.textColor = [UIColor redColor];
```

- **Setting font size**

```
1 self.firstLabel.font = [UIFont systemFontOfSize:24.0f];
```

# Using UILabel

The screenshot shows the Xcode Documentation Organizer window titled "Organizer – Documentation". The toolbar at the top includes icons for Devices, Repositories, Projects, Archives, and Documentation. The navigation bar below the title bar shows the path: iOS 5.1 Library > User Experience > Windows & Views > UILabel Class Reference. On the left, a sidebar search bar contains the query "UILabel". Below it, the "Reference" section is expanded, showing one result for "UILabel", which is selected and highlighted in blue. Other sections like "System Guides" and "Tools Guides" are also listed. The main content area on the right is titled "Tasks" and lists several properties under "Accessing the Text Attributes": `text` *property*, `font` *property*, `textColor` *property*, `textAlignment` *property*, `lineBreakMode` *property*, and `enabled` *property*. Further down, under "Sizing the Label's Text", are `adjustsFontSizeToFitWidth` *property*, `baselineAdjustment` *property*, `minimumFontSize` *property*, and `numberOfLines` *property*. Other sections include "Managing Highlight Values" with `highlightedTextColor` *property* and `highlighted` *property*, and "Drawing a Shadow" with `shadowColor` *property*.

# How the label links with code?

- **IBOutlet**
- The xib remember which outlet variable the view is pointing to.
- The code change the variable and inform the xib to update the view.

# Application Life Cycle

# Application Life Cycle

- main.m > UIApplication > AppDelegate Class
- AppDelegate is our app's entry point.

# <UIApplicationDelegate>

- (void)applicationDidFinishLaunching:(UIApplication \*)application;

- Entry point of the application.
- Execute every time when the app launched.

# <UIApplicationDelegate>

- (void)applicationDidBecomeActive:(UIApplication \*)application;

- Execute every time when the app is open from background to foreground. (Switch from other app)

# <UIApplicationDelegate>

- (void)applicationWillResignActive:(UIApplication \*)application;

- Execute when the app is moved from active state into inactive state.
- Including when the multi-task bar appear on bottom.
- Good point to pause any running logic, such as game loop.

# <UIApplicationDelegate>

- (void)applicationDidEnterBackground:(UIApplication \*)application;

- Execute when the user switch to home screen or other application.
- The app entered background.
- Good point to save all user data into persistent storage.

# <UIApplicationDelegate>

- (void) applicationWillTerminate:(UIApplication \*)application;

- Execute when the application is going to be terminated.
- Usually not much we can do here. All data should be saved when the app entered background.

# <UIApplicationDelegate>

- (BOOL)application:openURL:sourceApplication:annotation:

- Execute when the app is launched by calling the app URL scheme.
- App that is launched with *your-app-scheme://something*
- This is usually done by executing an app from the other app.
- Facebook uses this approach for Single Sign On.

# Delegates

# Delegate Protocol

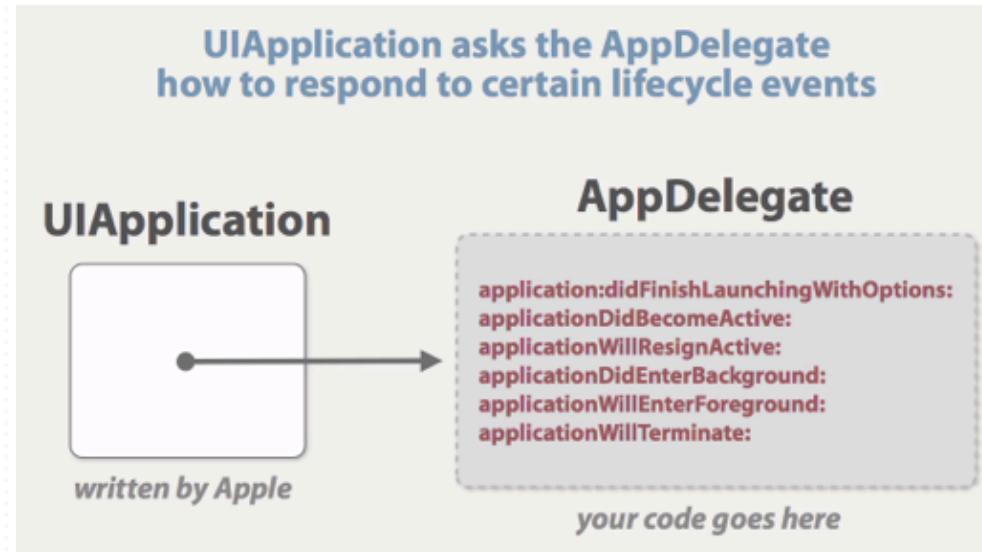

- Define a collection of methods.
- These methods act as communication bridge between two classes.
- The original class pass the task to the delegate to execute.
- We use delegate to customize behavior.

# Delegate Protocol

- Application cycle are handled in UIApplication in OS.
- We provide delegate method to define behavior when UIApplication informs us.

```
1 @protocol UIApplicationDelegate<NSObject>
2
3 - (void)applicationDidFinishLaunching: (UIApplication *)application;
4
5 @end
```

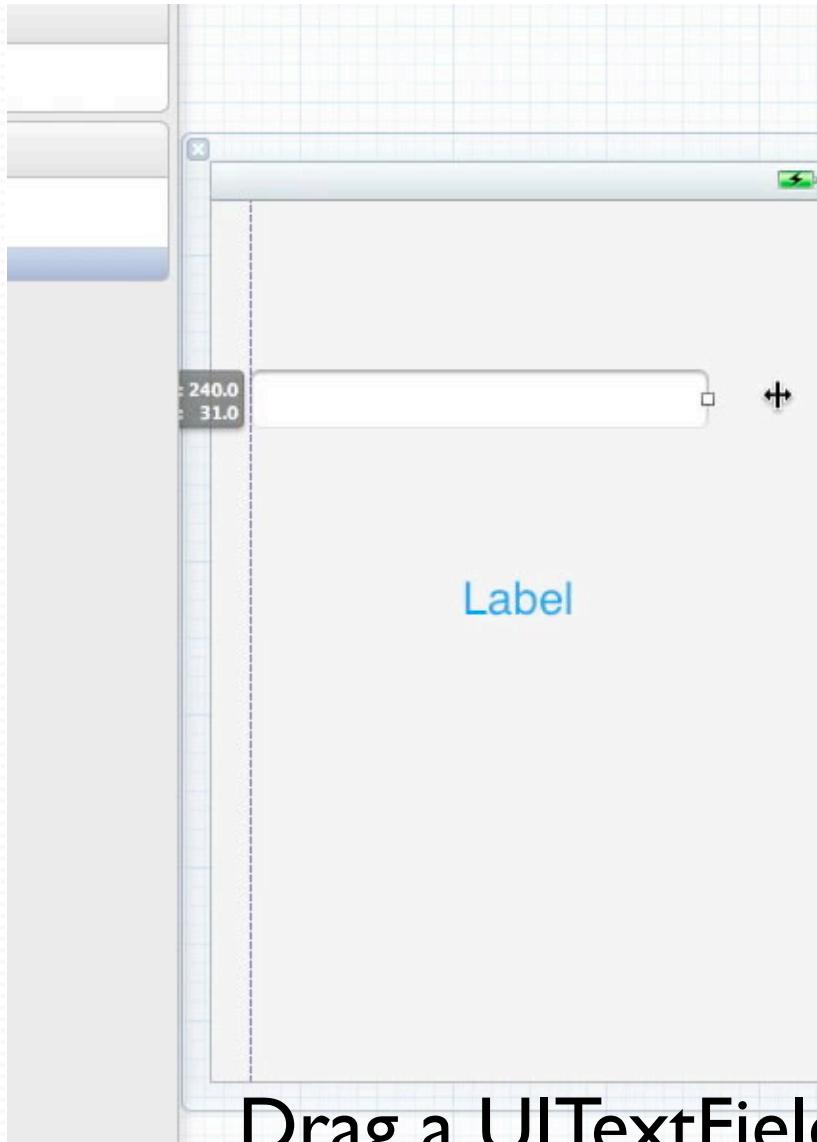

# Delegate Protocol

Graph from <http://pragmaticstudio.com/screencasts/rubymotion>

# Using UITextField

# Using UITextField

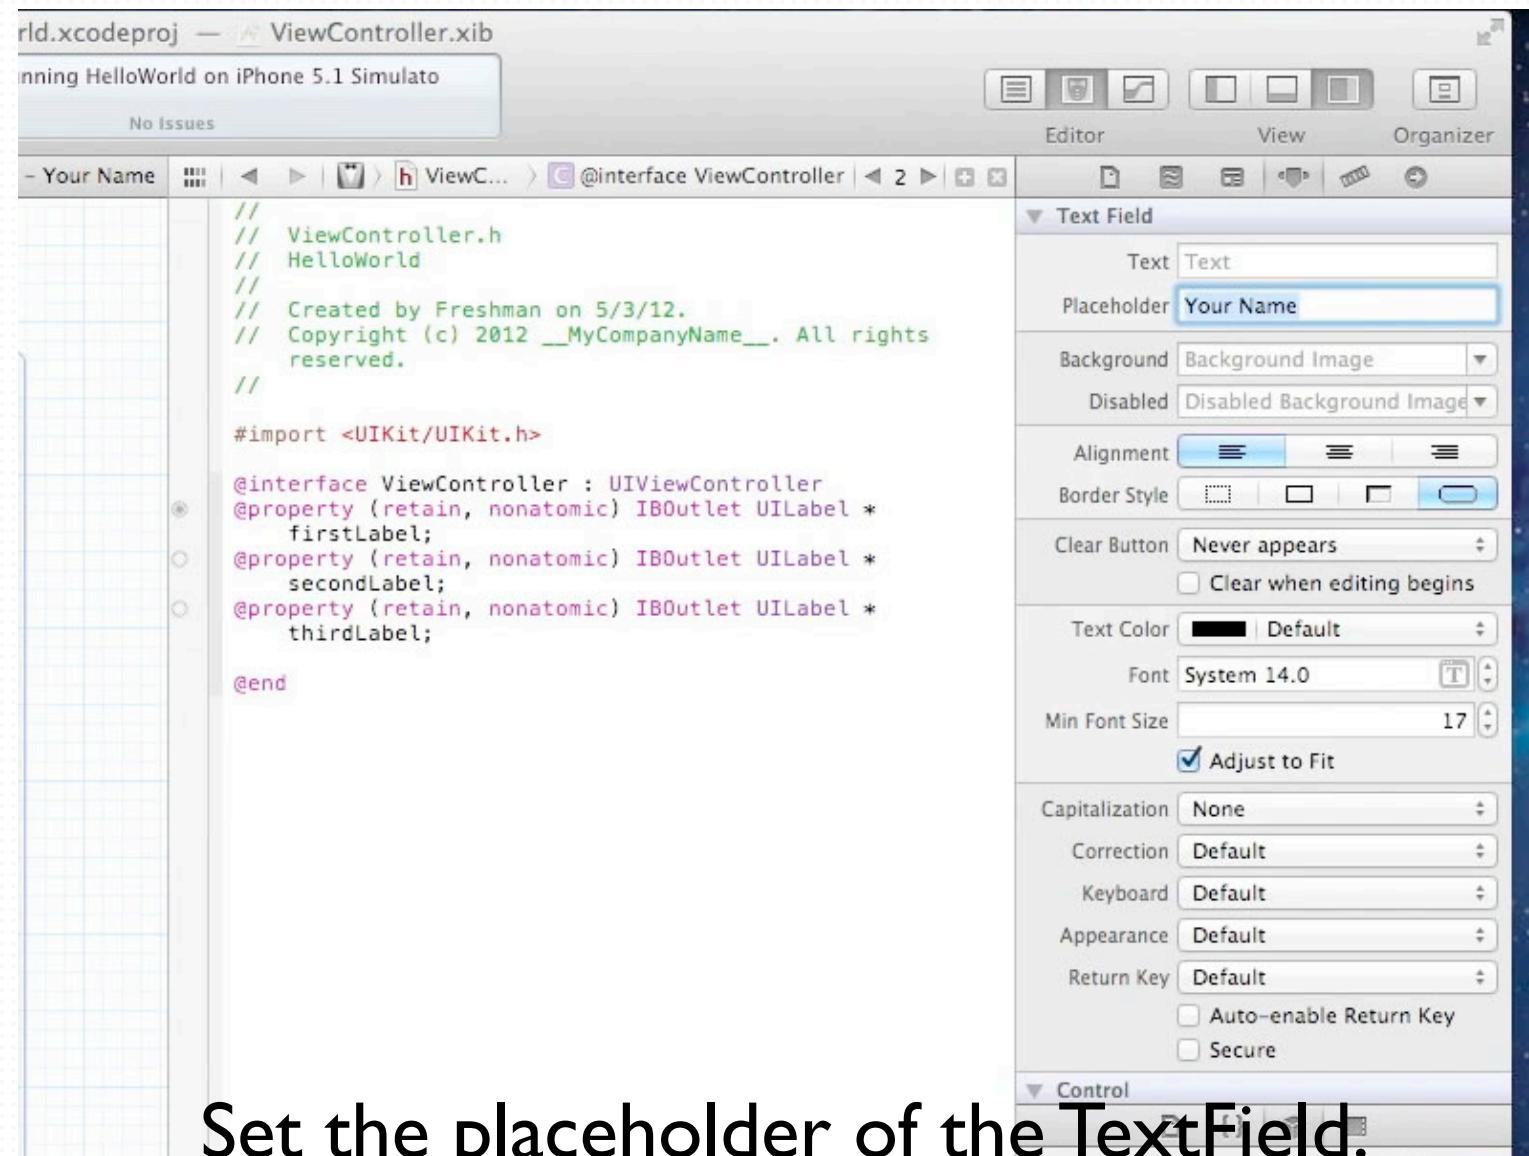

Drag a UITextField into the view.

```
// ViewController.h
// HelloWorld
//
// Created by Freshman on 5/3/12.
// Copyright (c) 2012 __MyCompanyName__. All rights reserved.

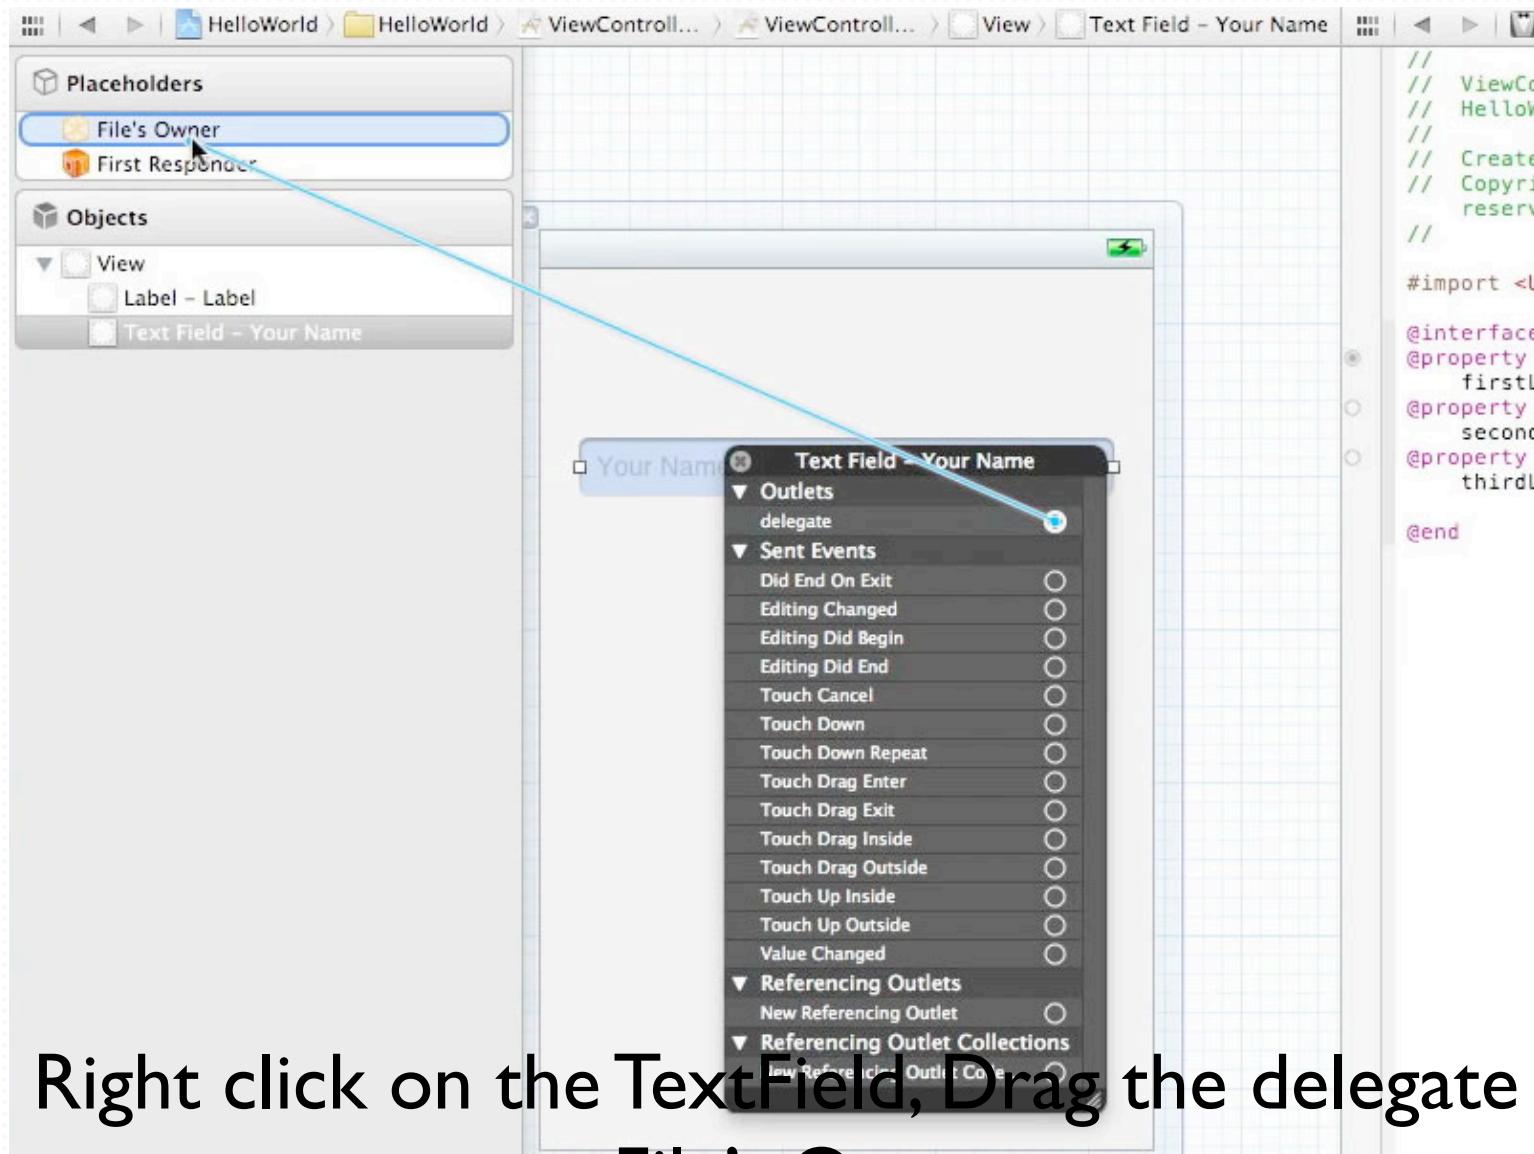

#import <UIKit/UIKit.h>

@interface ViewController : UIViewController
@property (retain, nonatomic) IBOutlet UILabel *firstLabel;
@property (retain, nonatomic) IBOutlet UILabel *secondLabel;
@property (retain, nonatomic) IBOutlet UILabel *thirdLabel;
@end
```

# Using UITextField

# Using UITextField

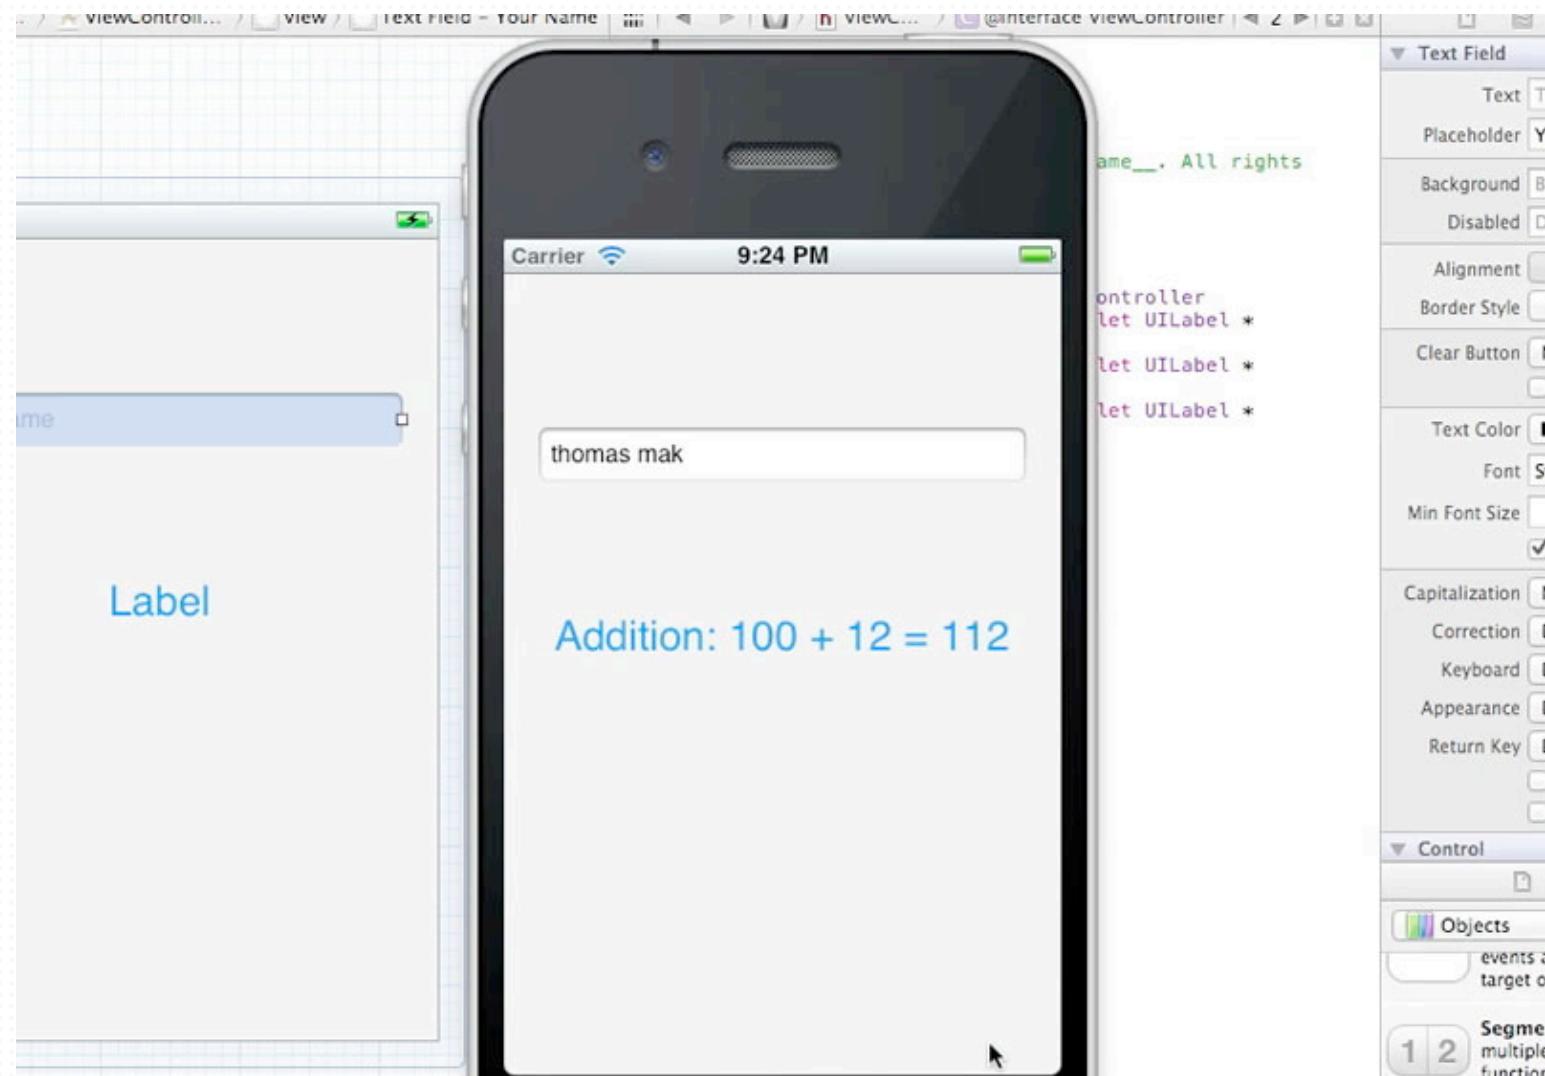

Right click on the TextField, Drag the delegate to File's Owner.

# Using UITextField

```
1 - (BOOL)textFieldShouldReturn:(UITextField*)textField  
2 {  
3     [textField resignFirstResponder];  
4     return NO;  
5 }
```

Add the above delegate method to the view controller .m file

# Using UITextField

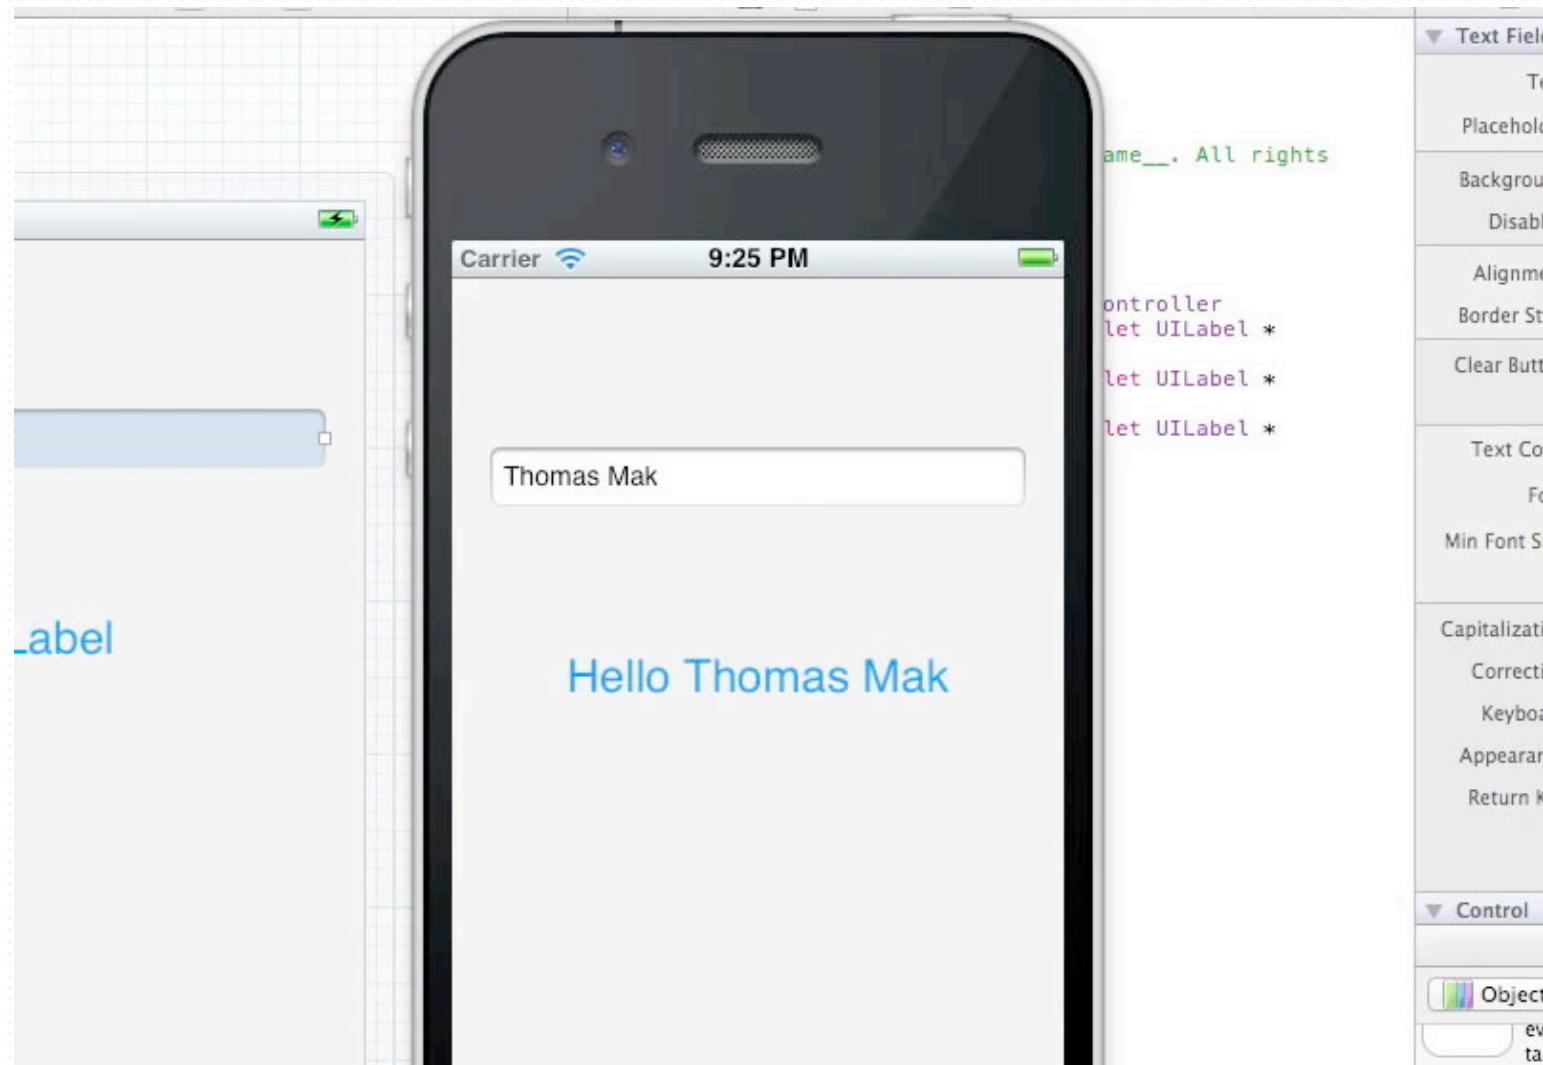

Let's test it in Simulator

# Using UITextField

```
1 - (BOOL)textFieldShouldReturn:(UITextField*)textField  
2 {  
3     [textField resignFirstResponder];  
4     self.firstlabel.text = [NSString  
stringWithFormat:@"Hello %@", textField.text];  
5     return NO;  
6 }
```

Add the highlighted code into the delegate method.

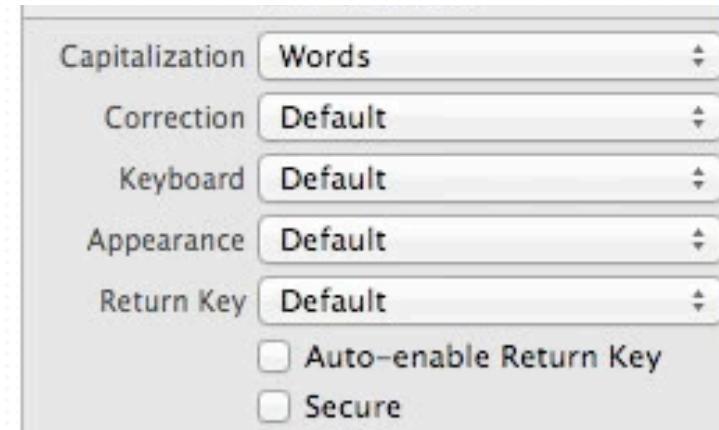

# Using UITextField

Let's test it in Simulator

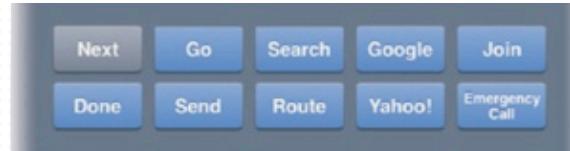

# Using UITextField

- Capitalization
- Correction
- Keyboard
- Appearance
- Return Key

# Using UITextField

- Return Key

Graph from TapWorthy book.

# Using UIButton

# Using UIButton

The screenshot shows the Xcode interface with a storyboard on the left and a code editor on the right.

**Storyboard:** A view controller is displayed with a label at the top containing the placeholder "Label" and a text input field below it labeled "Your Name".

**Code Editor (ViewController.h):**

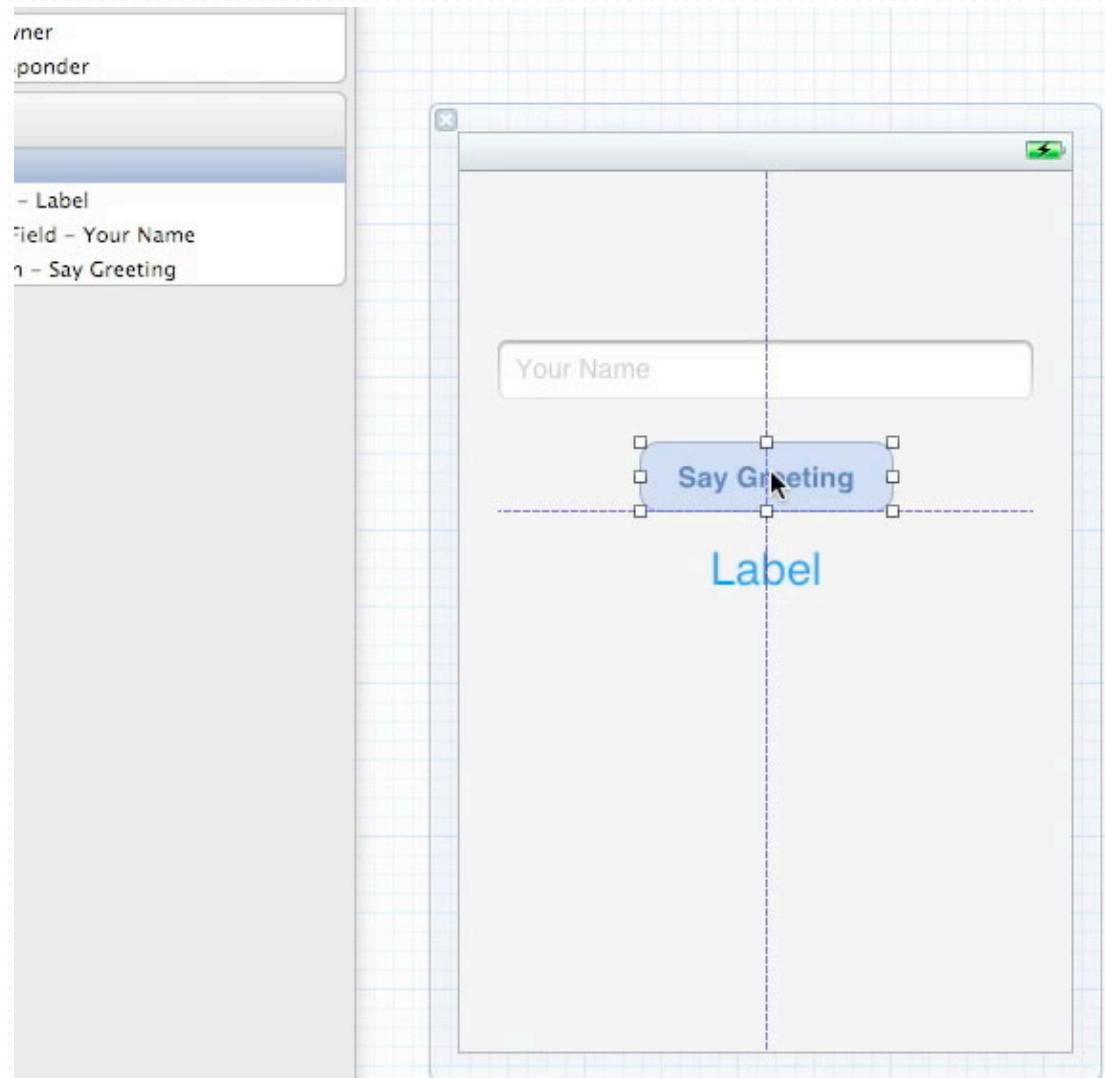

```
// Created by Freshman c
// Copyright (c) 2012 __
reserved.

#import <UIKit/UIKit.h>

@interface ViewController : UIViewController
@property (retain, nonatomic) IBOutlet UILabel *firstLabel;
@property (retain, nonatomic) IBOutlet UILabel *secondLabel;
@property (retain, nonatomic) IBOutlet UILabel *thirdLabel;
@end
```

Place an UIButton on view.

# Using UIButton

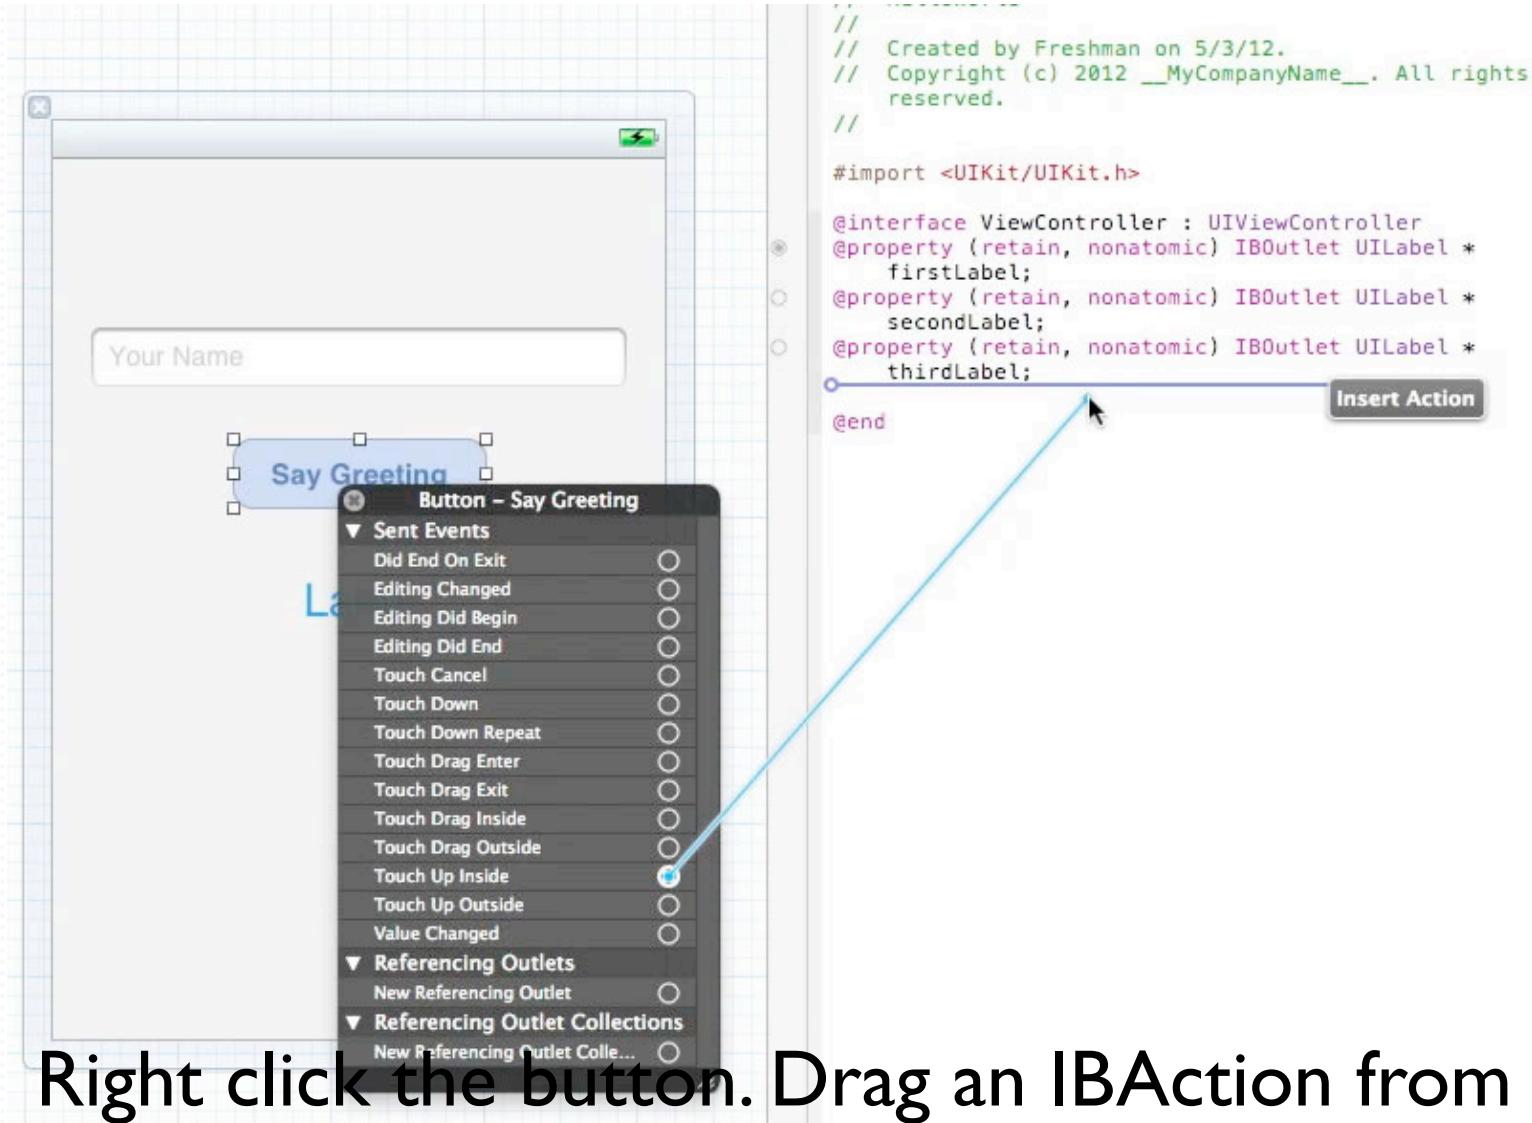

```
// HELLOWORLD
//
// Created by Freshman
// Copyright (c) 2012
// reserved.

//
#import <UIKit/UIKit.h>

@interface ViewController : UIViewController
@property (retain, nonatomic) IBOutlet UILabel *firstLabel;
@property (retain, nonatomic) IBOutlet UILabel *secondLabel;
@property (retain, nonatomic) IBOutlet UILabel *thirdLabel;
@end
```

Fill in the text and put into right place.

# Using UIButton

Right click the button. Drag an IBAction from  
“Touch Up Inside”

# Using UIButton

The screenshot shows a Xcode interface. On the left is a storyboard containing a single view with a text field labeled "Your Name" and a button labeled "Say". A connection editor popover is open over the button, set to "Action" mode. The "Object" is "File's Owner", "Name" is "sayGreeting", "Type" is "id", "Event" is "Touch Up Inside", and "Arguments" is "Sender". The "Connect" button is highlighted. To the right is a portion of a .h file:

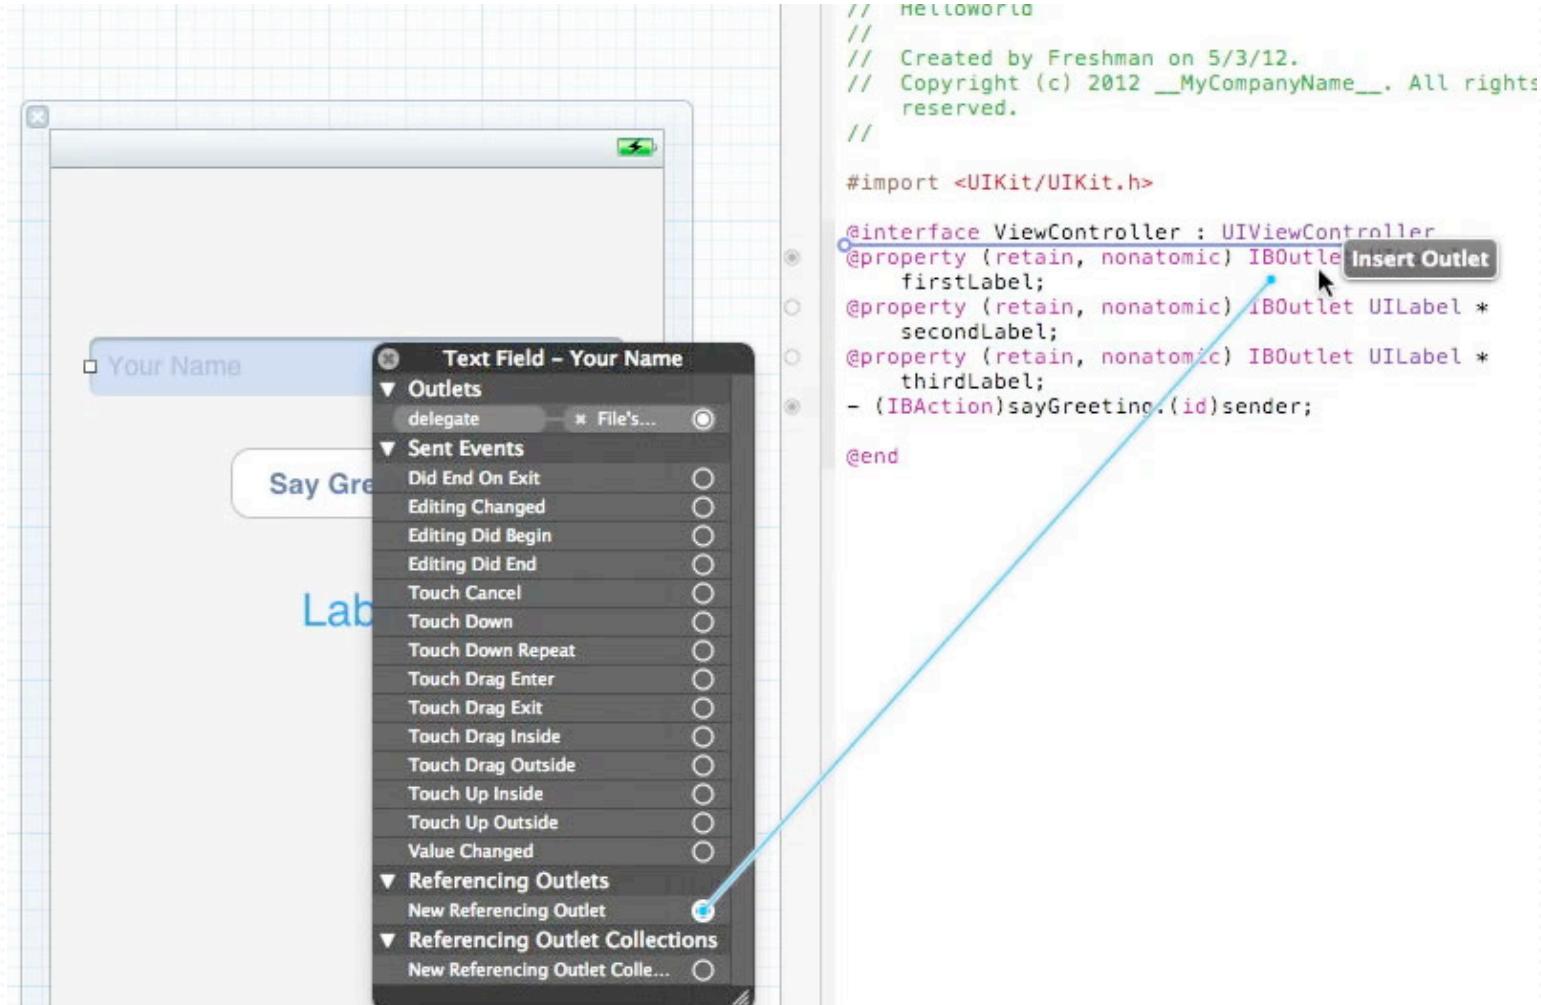

```
// MELLOWORLD
// Created by Freshman on 5/3/12.
// Copyright (c) 2012 __MyCompanyName__. All rights reserved.

#import <UIKit/UIKit.h>

@interface ViewController : UIViewController
@property (retain, nonatomic) IBOutlet UILabel *firstLabel;
@property (retain, nonatomic) IBOutlet UILabel *secondLabel;
@property (retain, nonatomic) IBOutlet UILabel *thirdLabel;
@end
```

Give the IBAction a name, such as 'sayGreeting'

# Using UIButton

We need a reference to the textfield. Drag an IBOOutlet of the textfield to interface.

# Using UIButton

The screenshot shows the Xcode interface with a storyboard on the left and a code editor on the right. In the storyboard, there is a text field labeled 'Your Name' and a button labeled 'Say Greet'. A connection inspector popover is open over the text field, showing the following details:

- Connection: Outlet
- Object: File's Owner
- Name: nameTextField
- Type: UITextField

The 'Outlets' section of the popover is expanded, showing the 'delegate' outlet connected to 'File's...'. Other sections like 'Sent Events' and 'Referencing Outlets' are also visible.

On the right, the code editor displays the ViewController.h file with the following content:

```
// MELLOWORLD
//
// Created by Freshman on 5/3/12.
// Copyright (c) 2012 __MyCompanyName__. All rights reserved.

#import <UIKit/UIKit.h>

@interface ViewController : UIViewController
@property (retain, nonatomic) IBOutlet UILabel *firstLabel;
@property (retain, nonatomic) IBOutlet UILabel *secondLabel;
@property (retain, nonatomic) IBOutlet UILabel *thirdLabel;
- (IBAction)sayGreeting:(id)sender;

@end
```

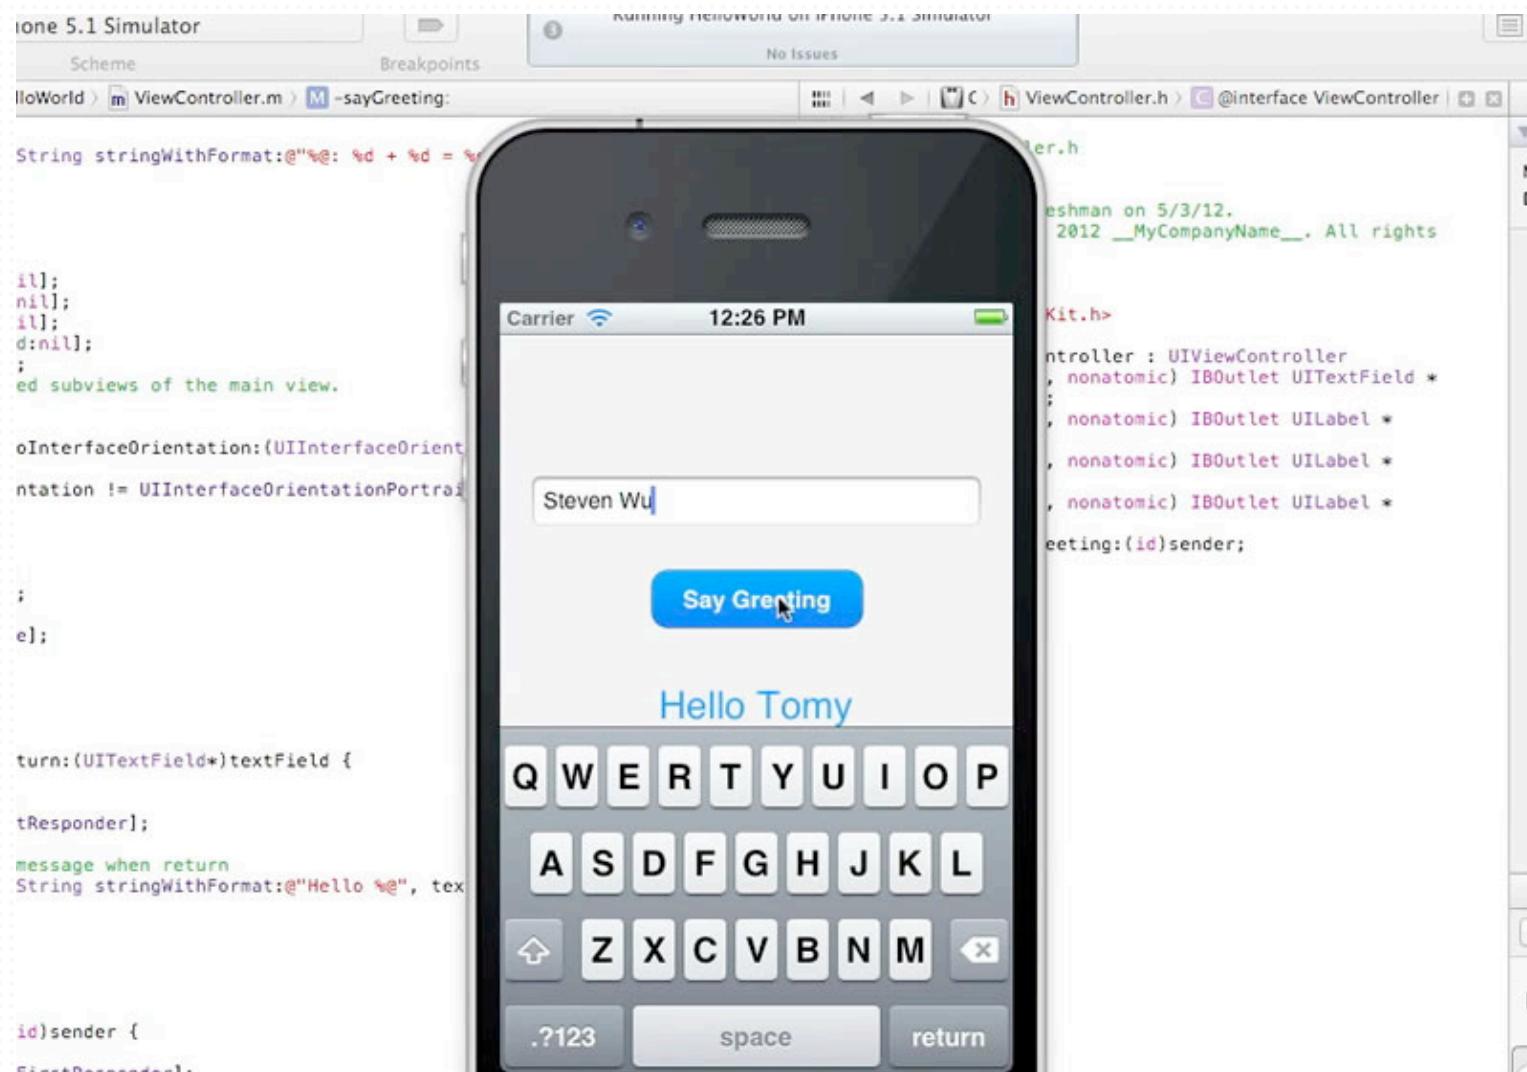

Name the IBOutlet 'nameTextField'

# Using UIButton

```
1 - (IBAction)sayGreeting:(id)sender {
2     // hide the keyboard.
3     [self.nameTextField resignFirstResponder];
4
5     // Show the greeting message when return
6     self.firstLabel.text = [NSString
stringWithFormat:@"Hello %@", self.nameTextField.text];
7
8 }
```

Implement the sayGreeting method.

# Using UIButton

Test the app in simulator.

# Extracting Method

- Now that we have similar behavior in both text field return delegate and button action method.
- We can extract them to have cleaner code.

# Extracting Method

```
1 - (void)showGreetingMessage {
2     // hide the keyboard.
3     [self.nameTextField resignFirstResponder];
4
5     // Show the greeting message when return
6     self.firstLabel.text = [NSString
stringWithFormat:@"Hello %@", self.nameTextField.text];
7 }
8
9
10 // TextField delegates
11 - (BOOL)textFieldShouldReturn:(UITextField*)textField {
12
13     [self showGreetingMessage];
14
15     return NO;
16 }
17
18 - (IBAction)sayGreeting:(id)sender {
19     [self showGreetingMessage];
20 }
```

# Private and Public

- Methods are private when it is declared in .m
- The following interface code are declared in .m

```
1 @interface ViewController ()  
2 - (void)showGreetingMessage;  
3 @end
```

# Private and Public

- Note that there is empty () after the ViewController interface.
- () is called Category in Obj-C.
- In simple words, this allows us to declare private methods and properties.

```
1 @interface ViewController ()  
2 - (void)showGreetingMessage;  
3 @end
```

# Private and Public

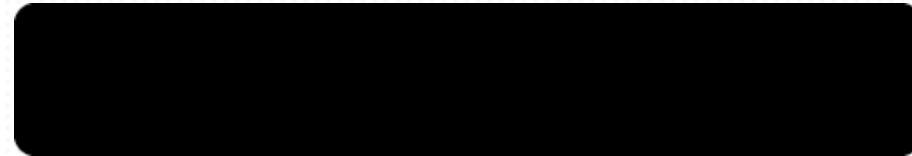

- Methods that are declared in header are public.
- Public methods are visible by others.
- Others can invoke the public methods.

```
1 @interface ViewController  
2 - (void)showGreetingMessage;  
3 @end
```

# Using Image in iOS

- filename.png
- filename@2x.png
- filename.jpg
- filename@2x.jpg

# Using Image in iOS

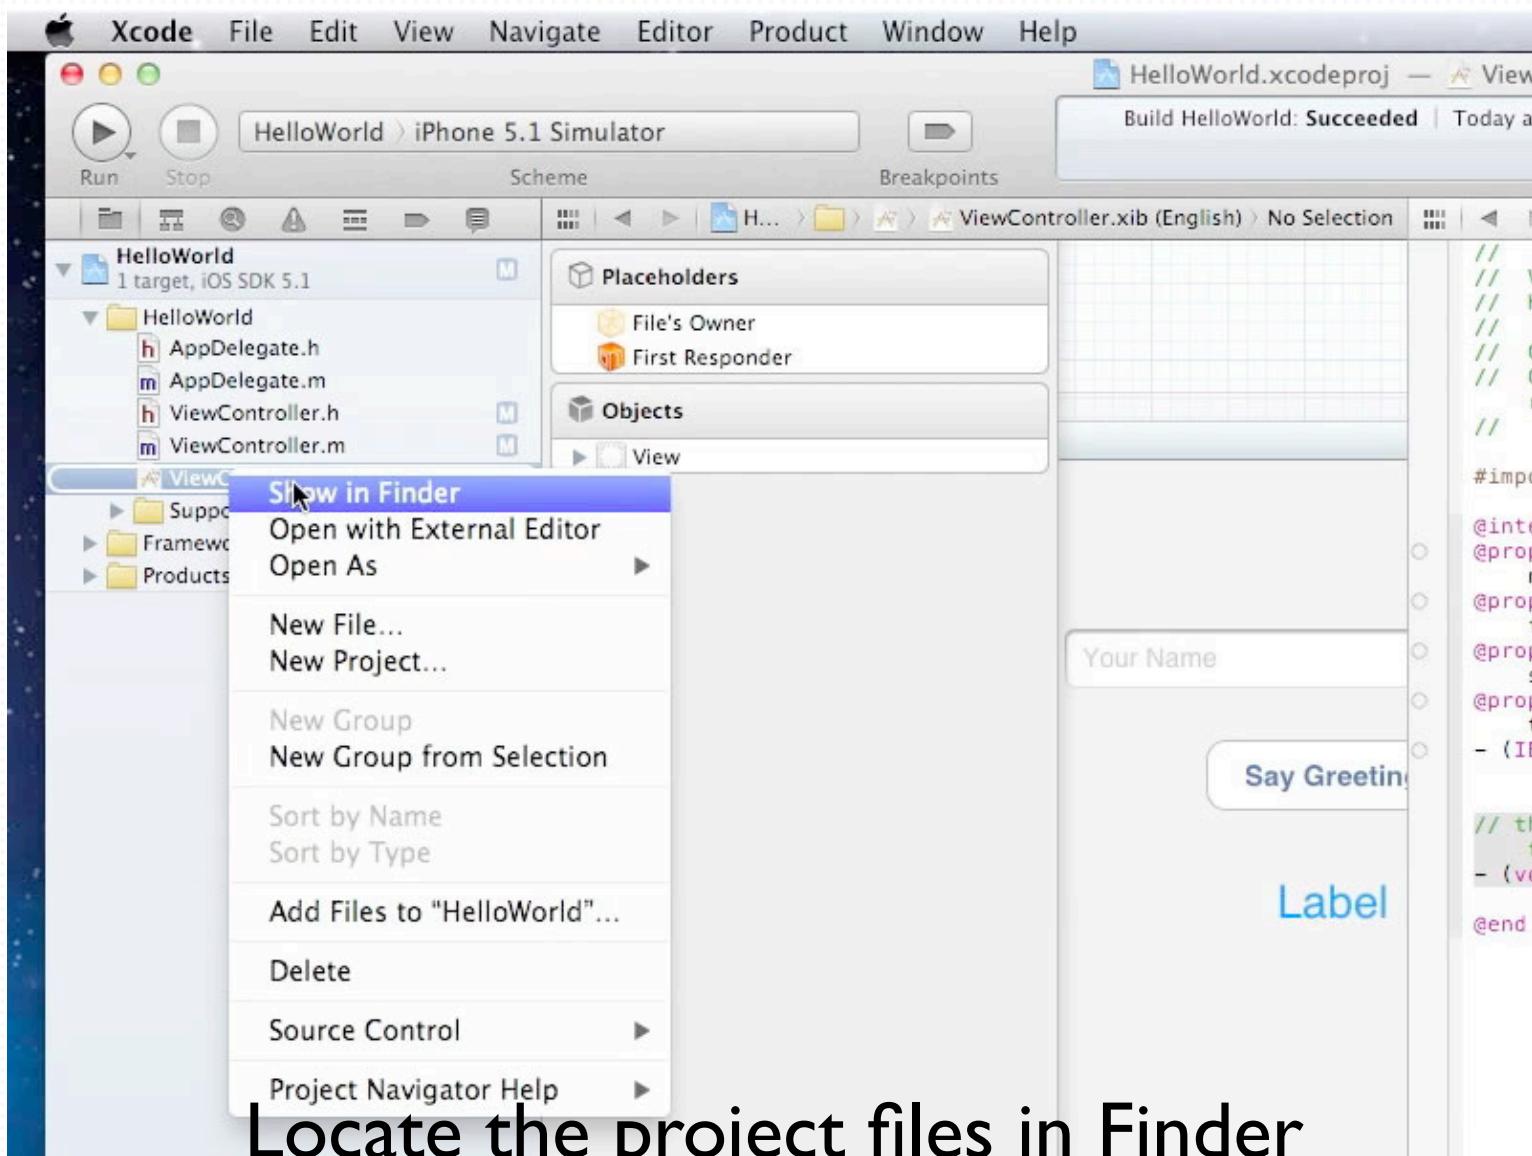

button@2x.png  
474 x 80

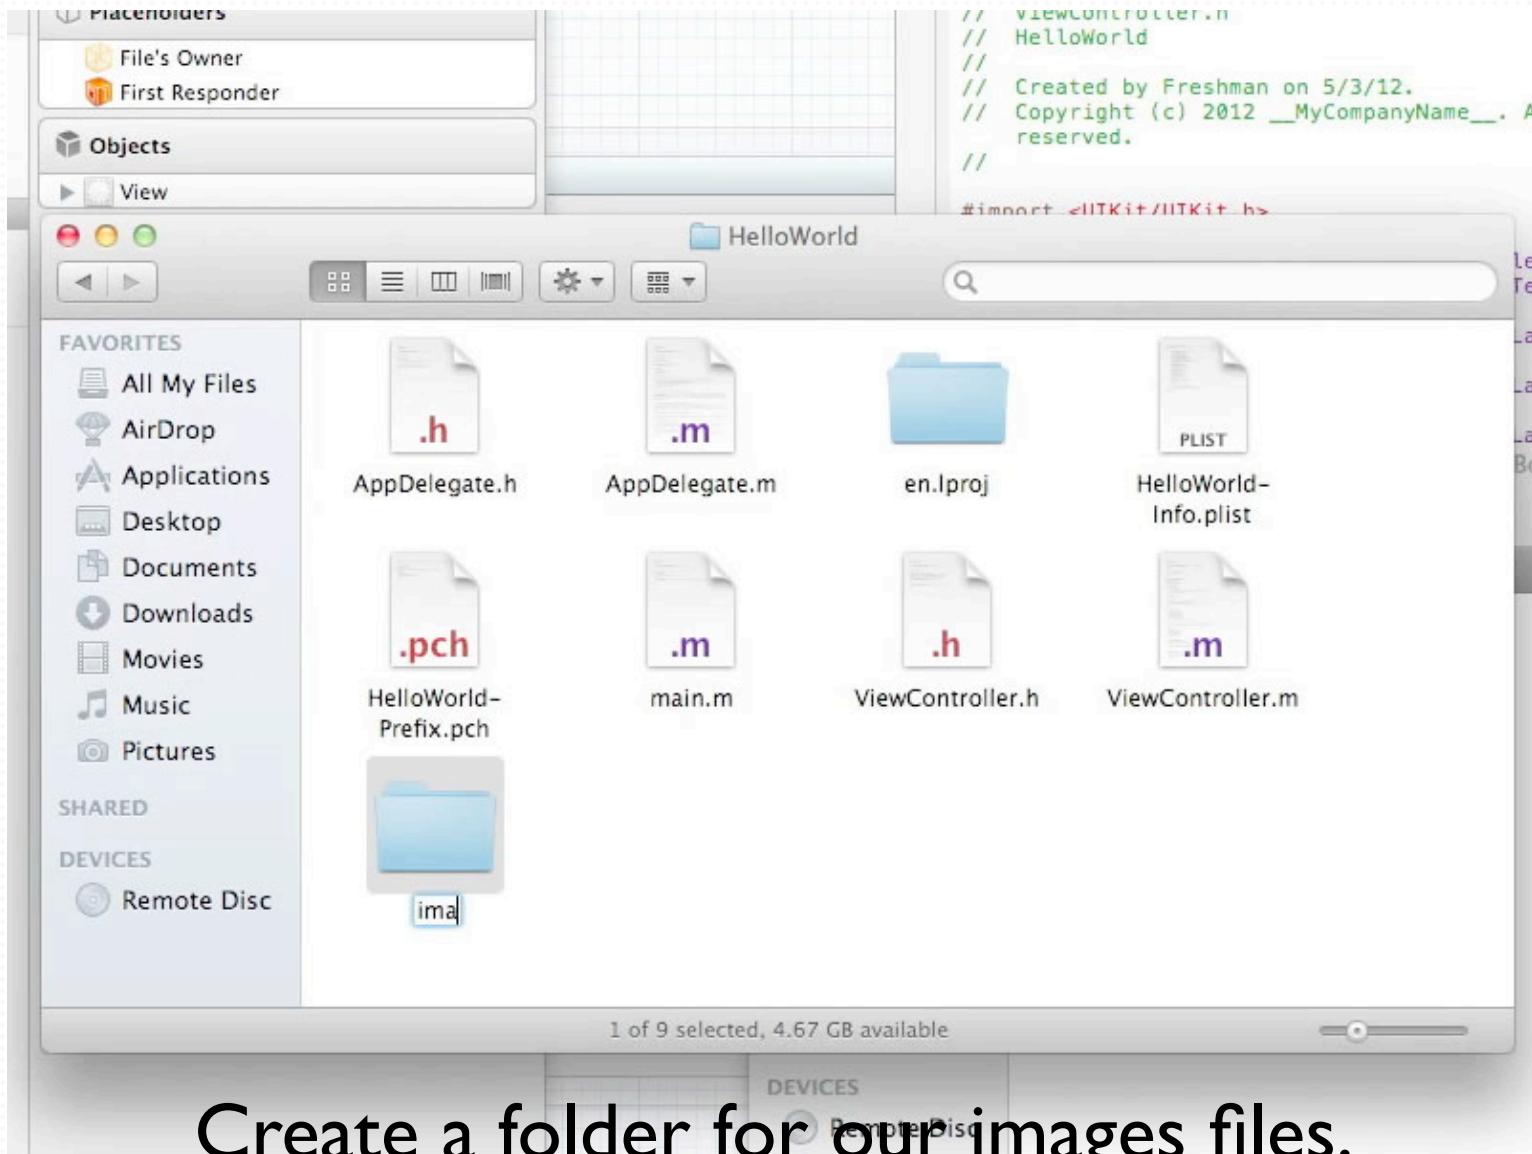

button.png  
237 x 40

# Images in UIButton

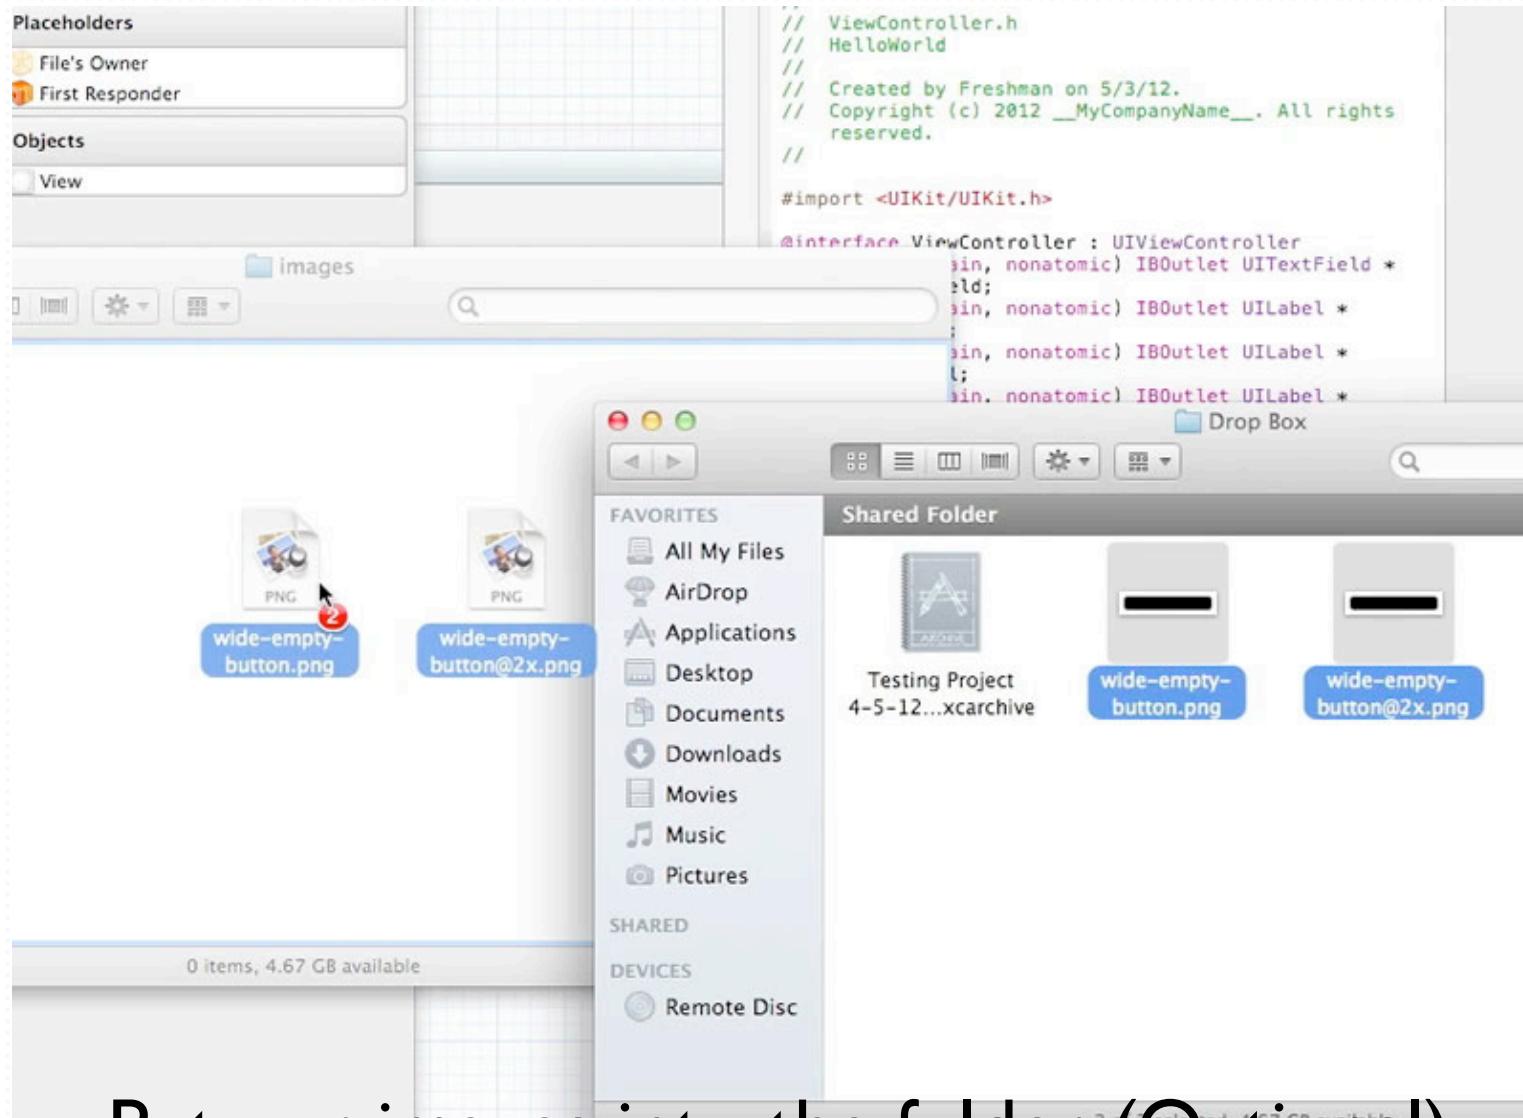

Locate the project files in Finder

# Images in UIButton

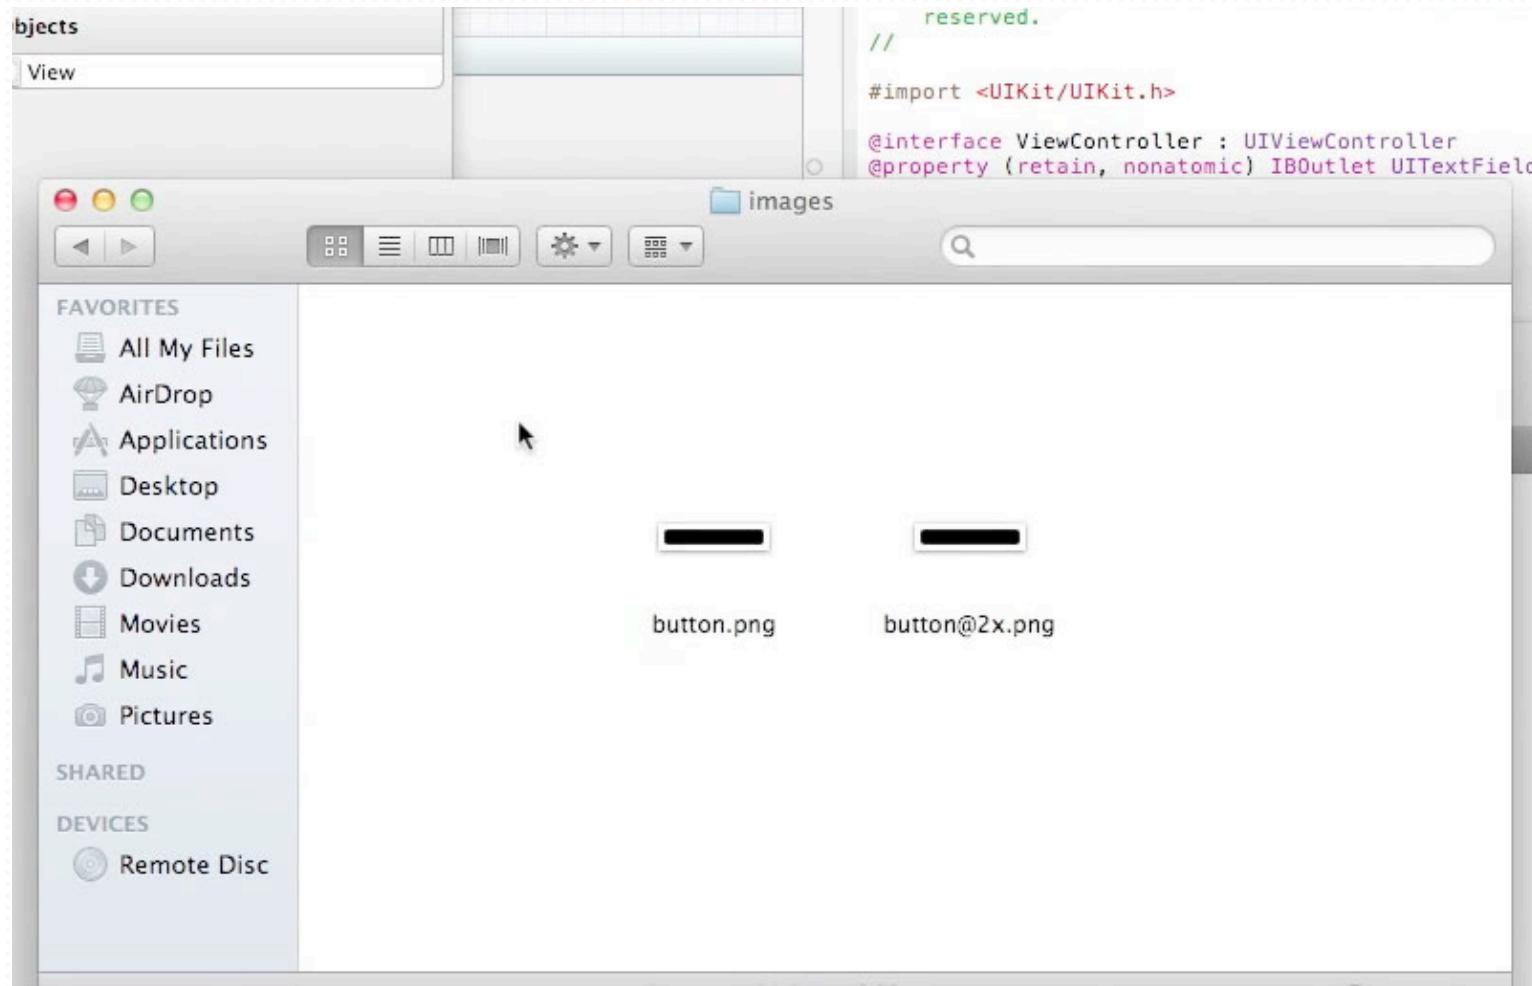

# Images in UIButton

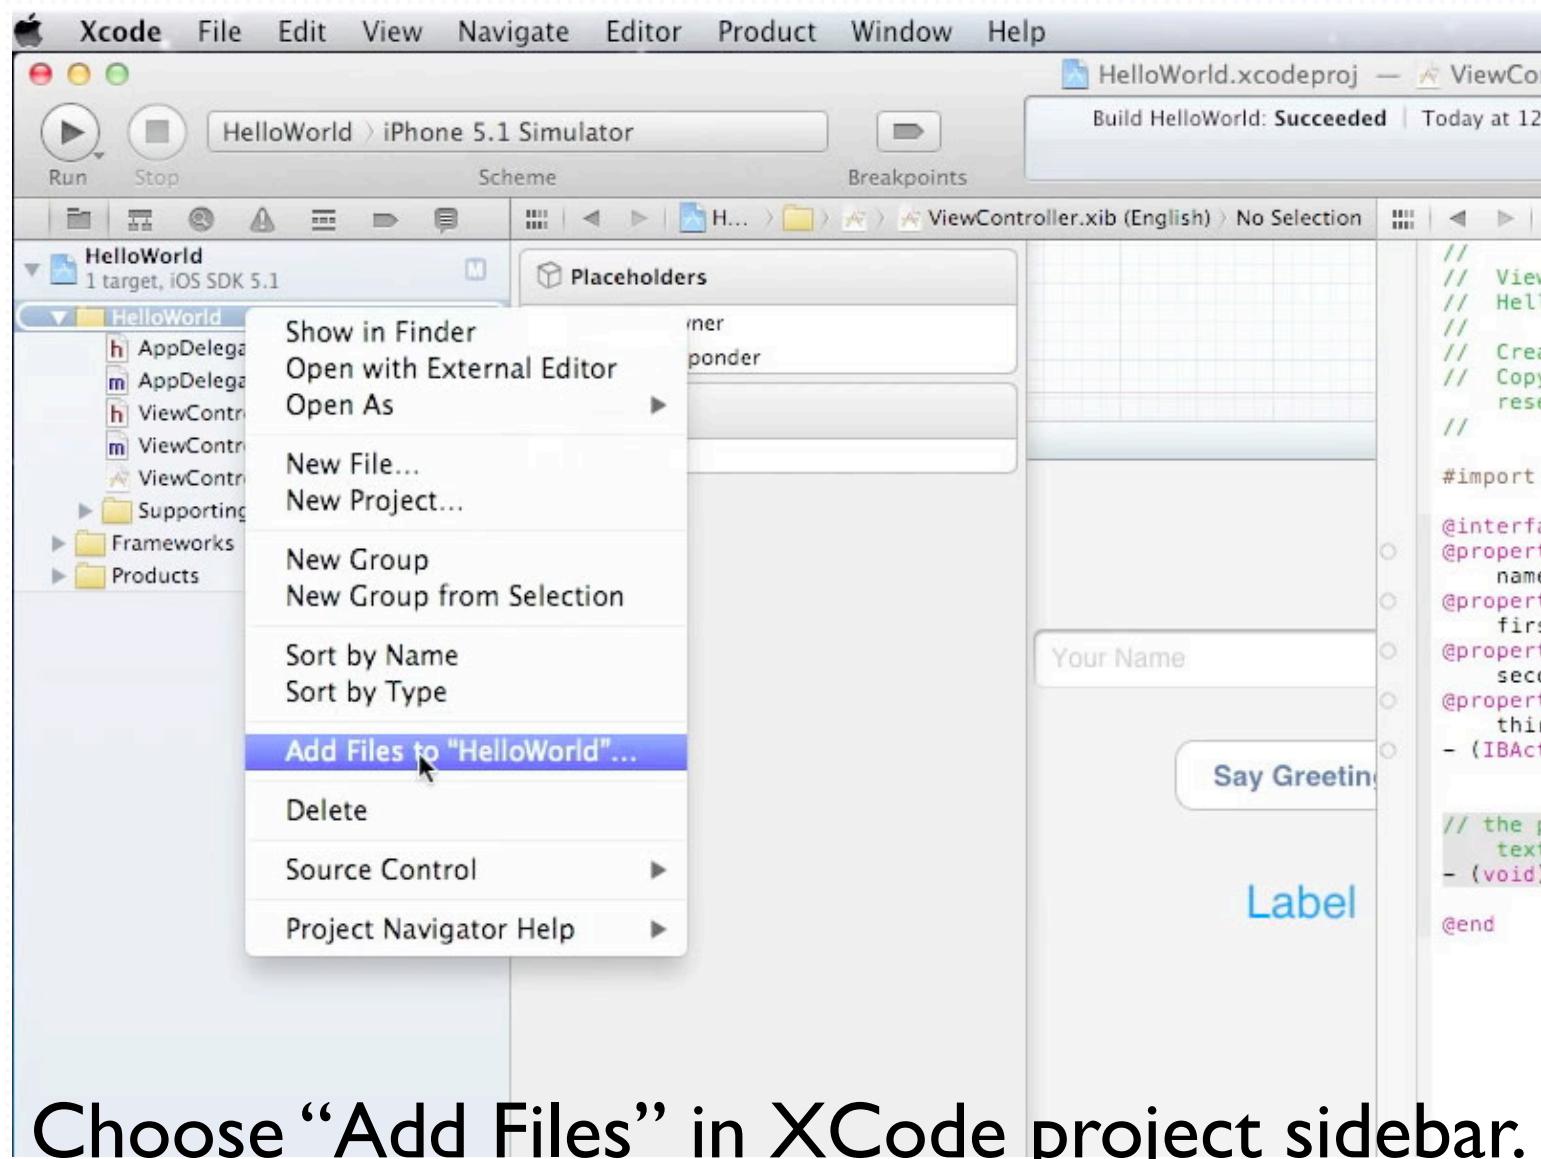

Put our images into the folder. (Optional)

# Images in UIButton

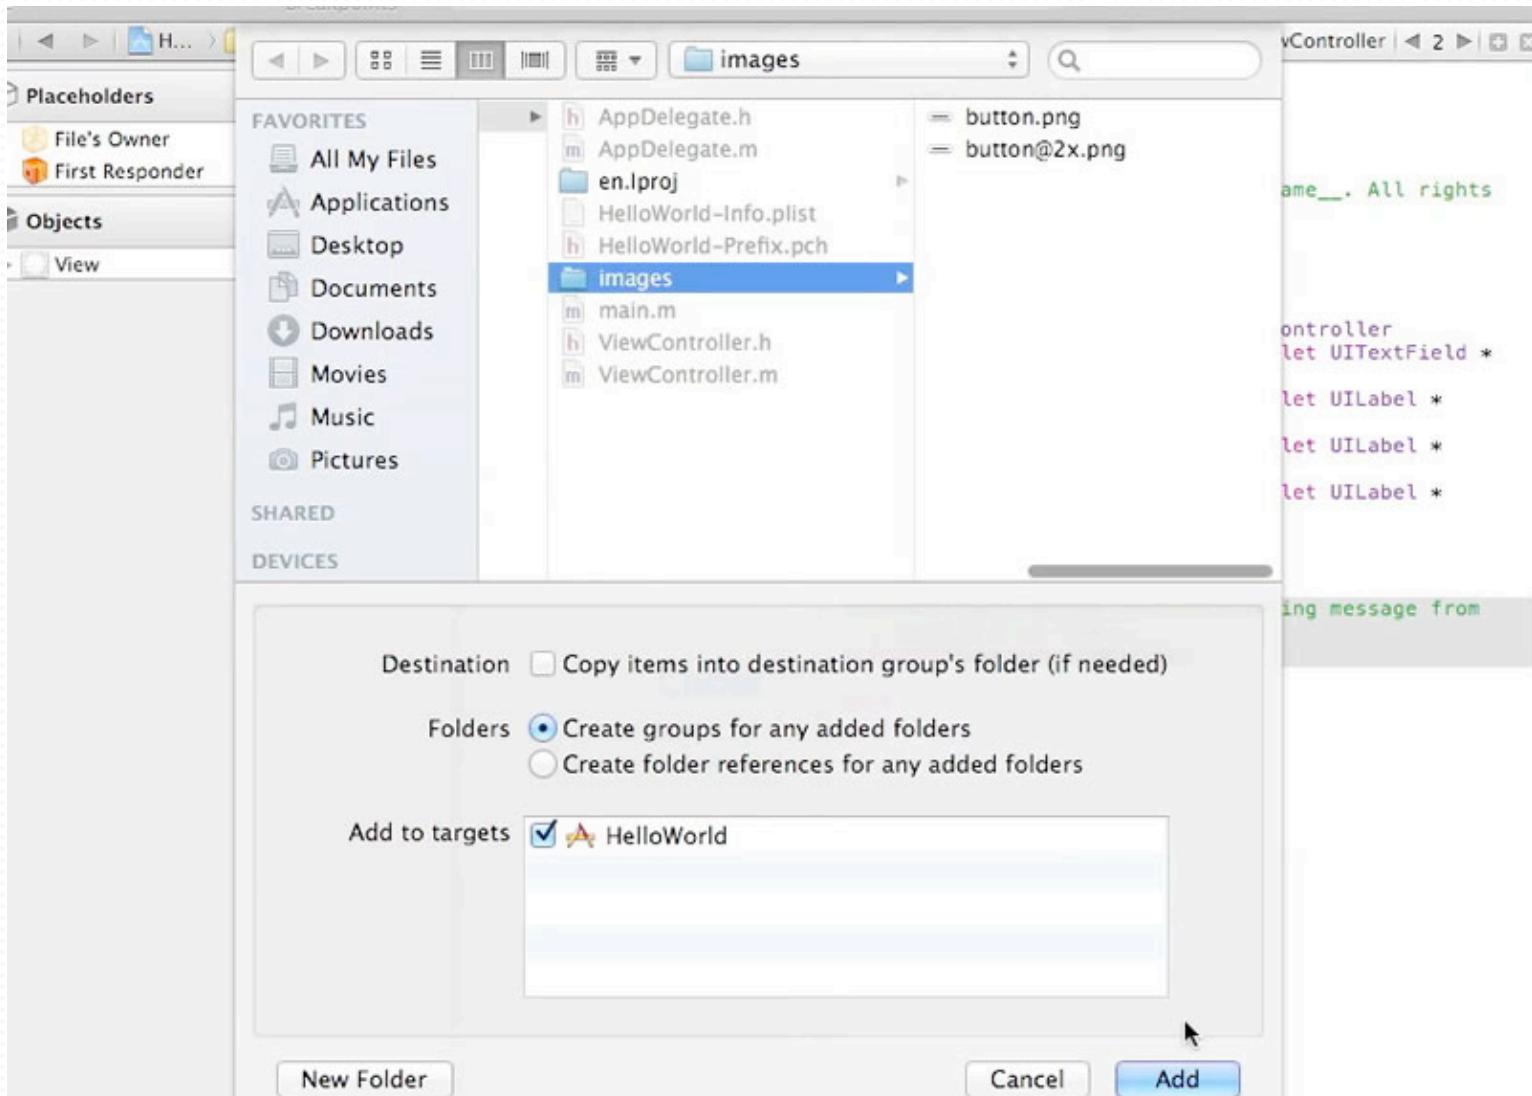

Make sure our image names are relevant.

# Images in UIButton

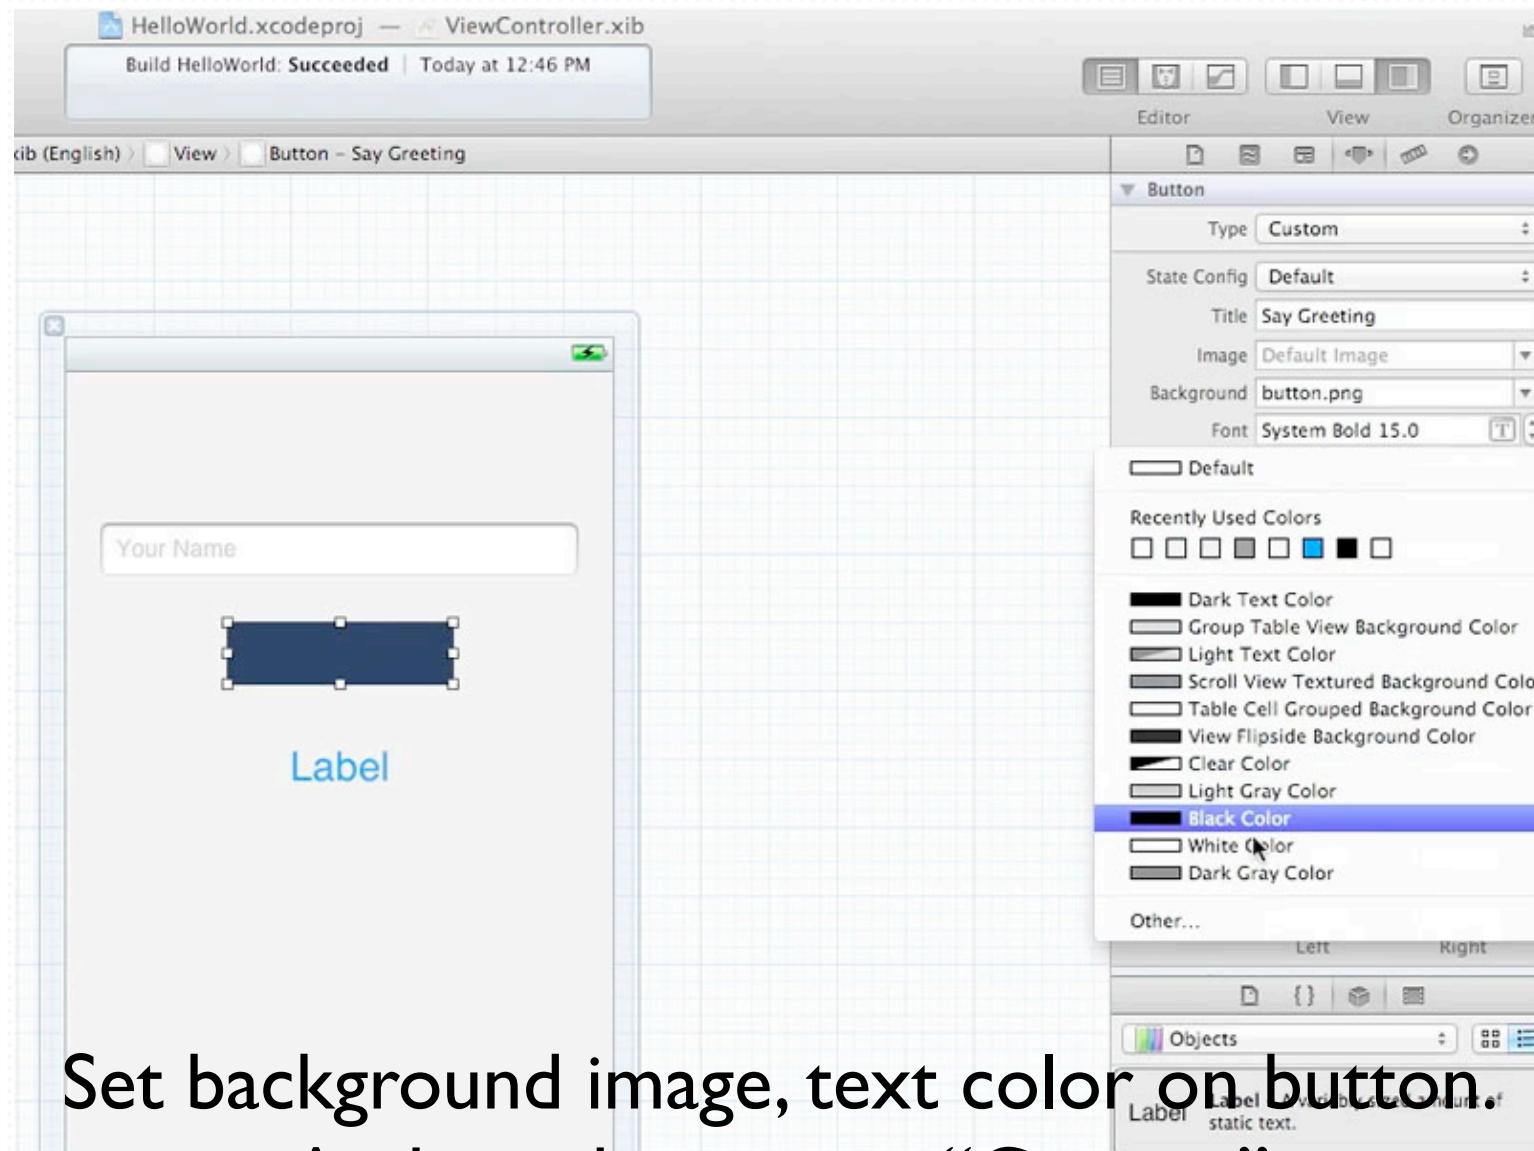

Choose “Add Files” in XCode project sidebar.

# Images in UIButton

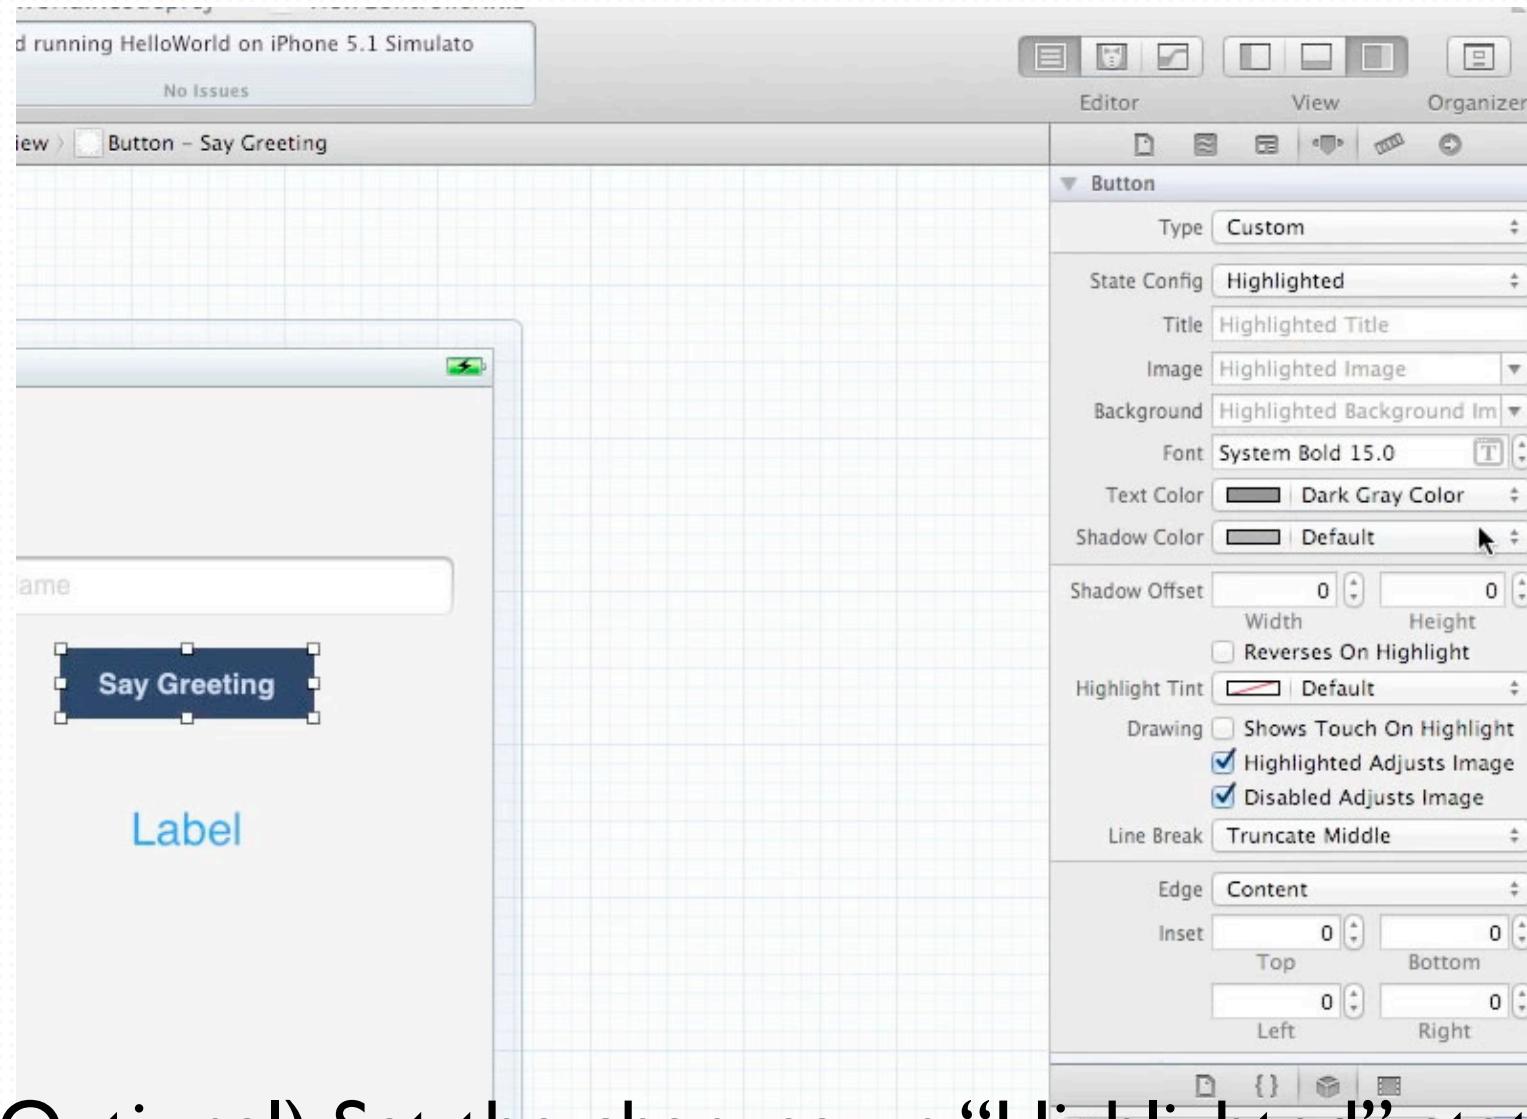

Select the files or folders that we are going to import.

# Images in UIButton

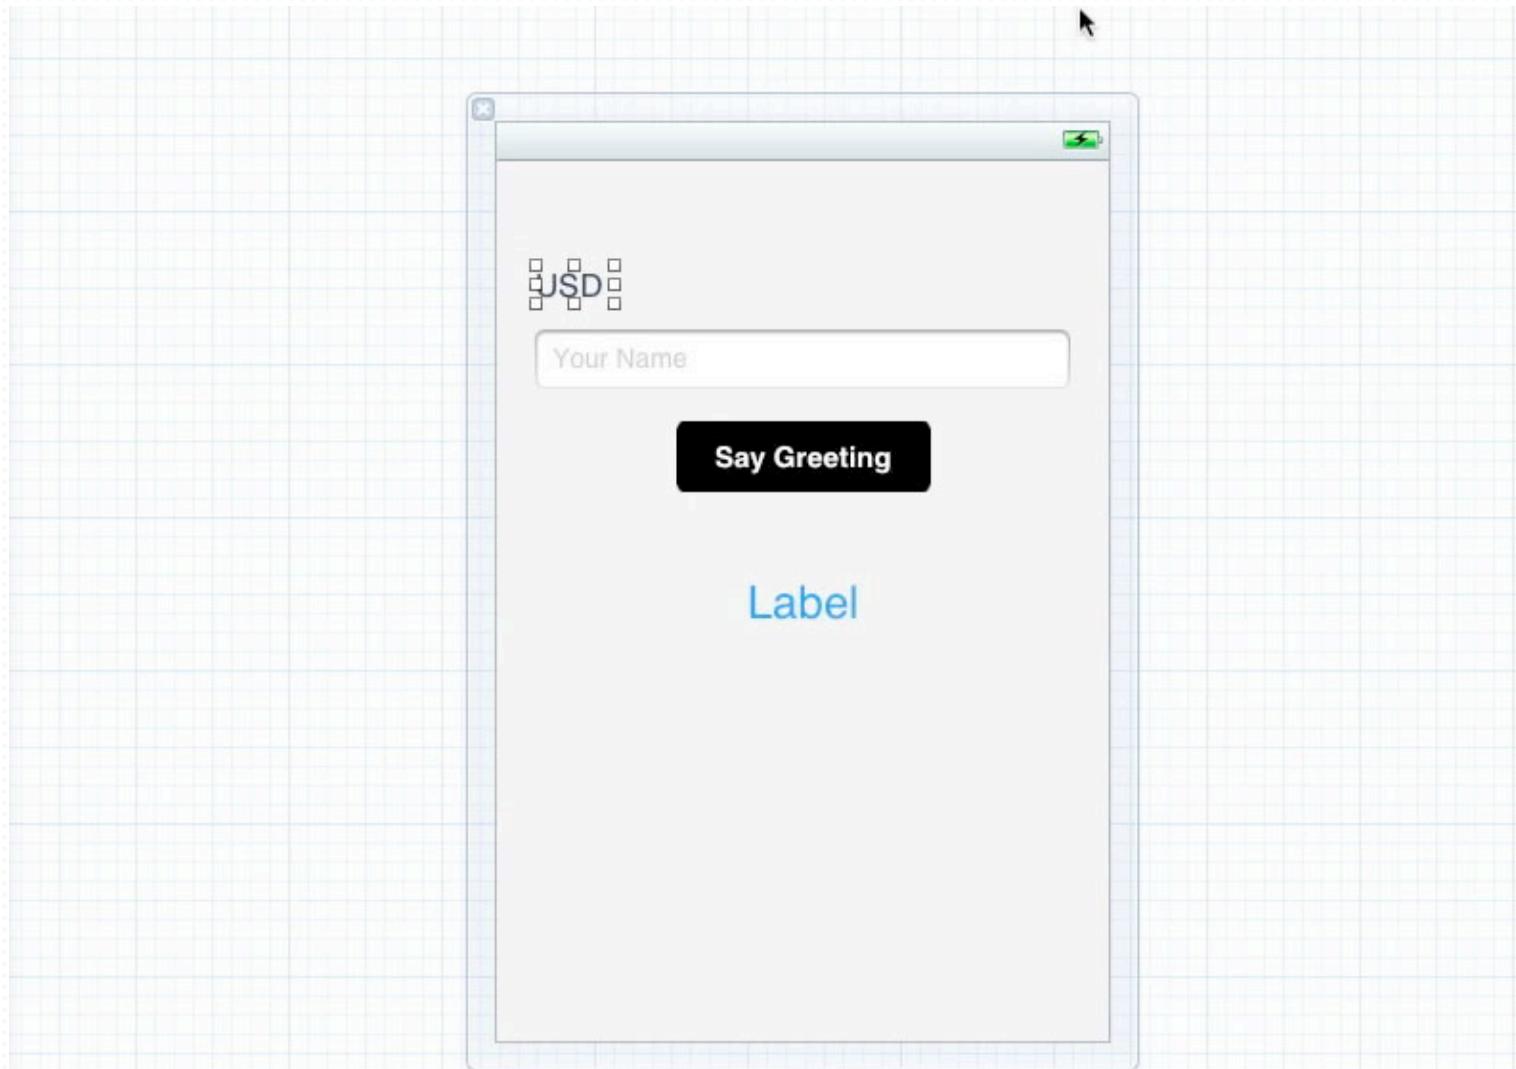

# Images in UIButton

(Optional) Set the changes on “Highlighted” state.

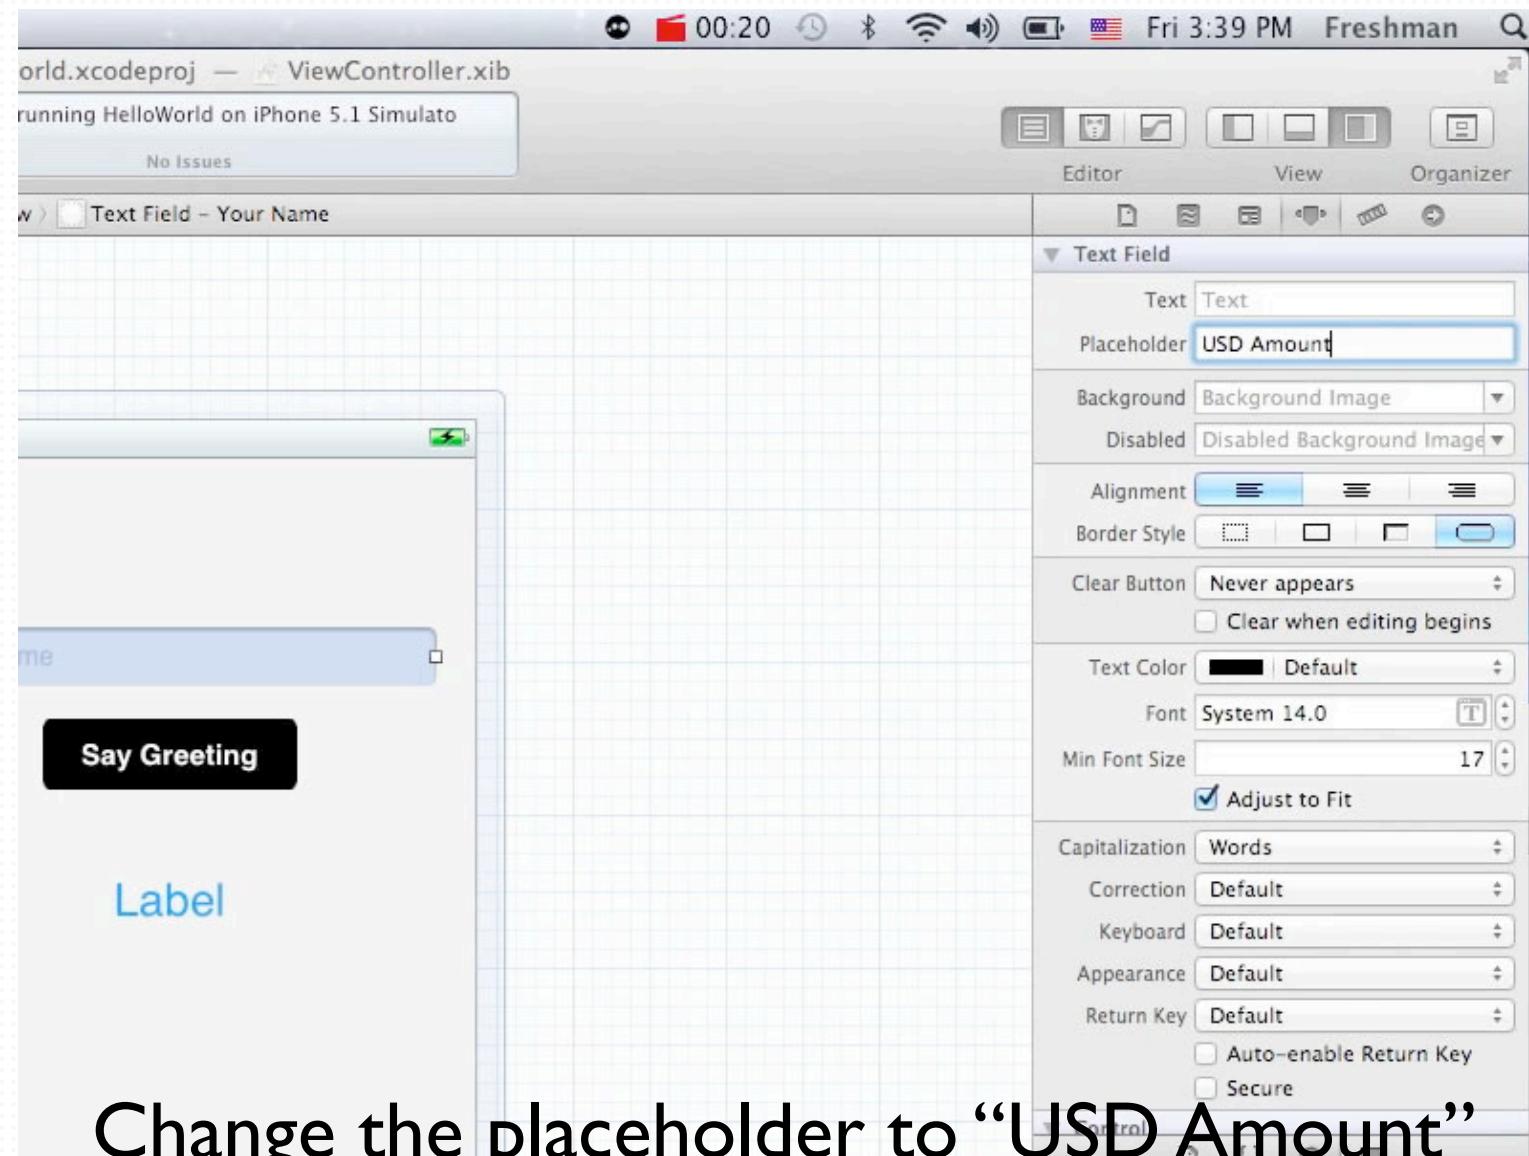

# Build a Currency Convertor

# Using UIButton

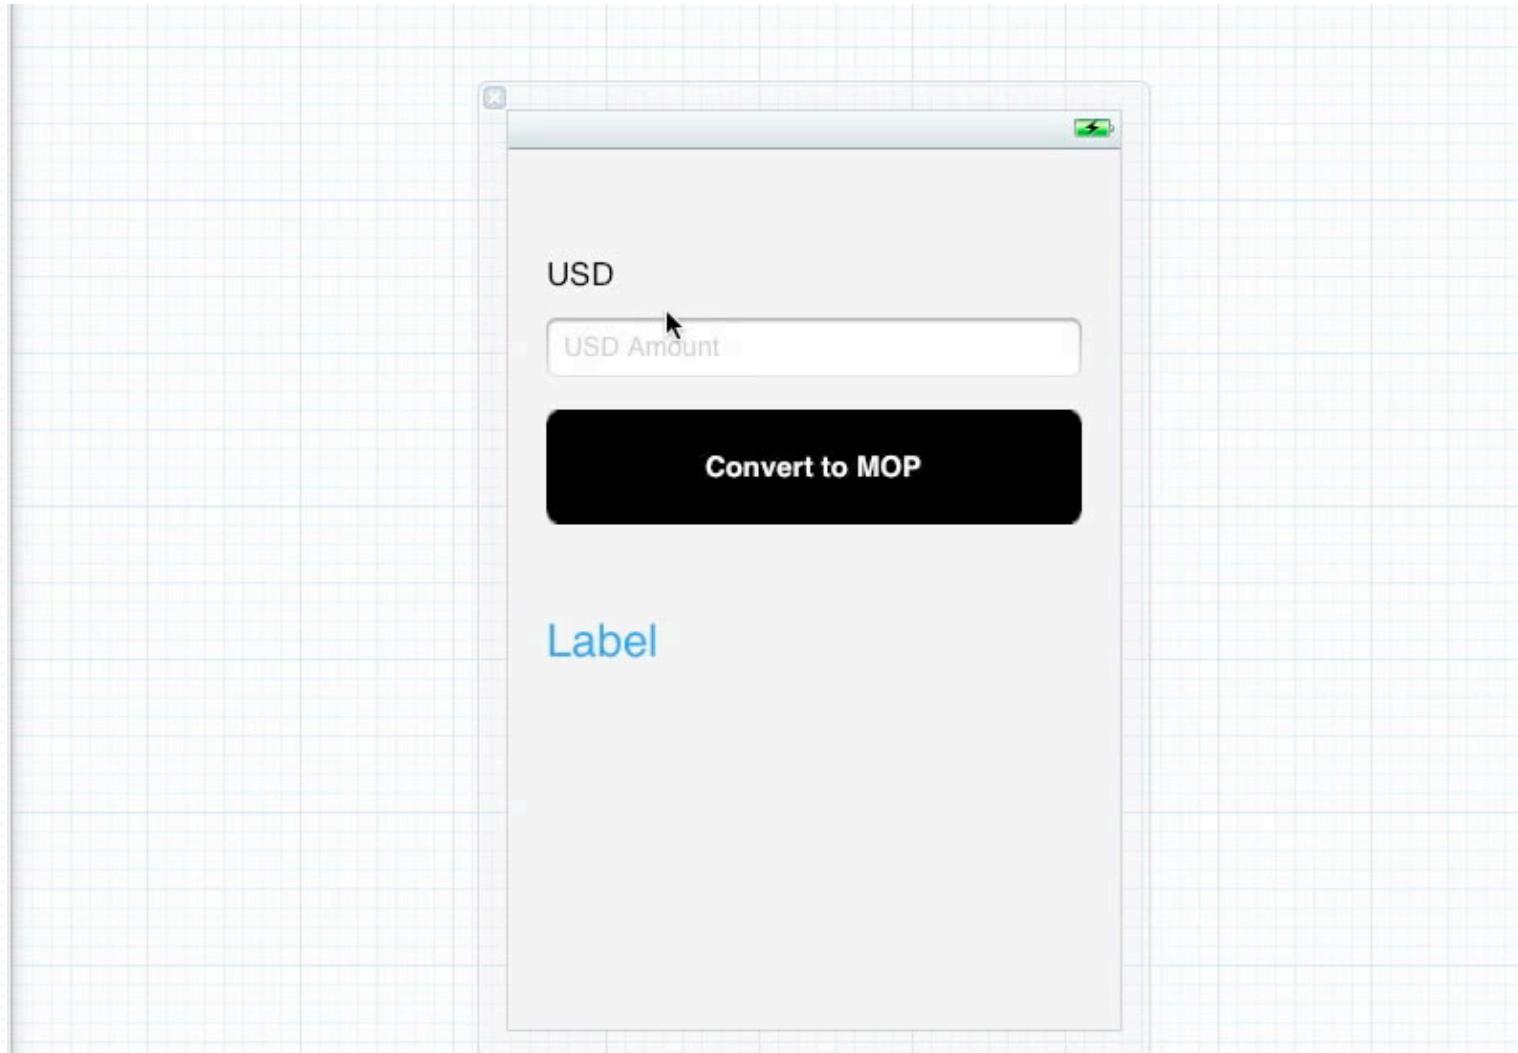

Let's modify the label views for the convertor.

# Using UIButton

Change the placeholder to “USD Amount”

# Using UIButton

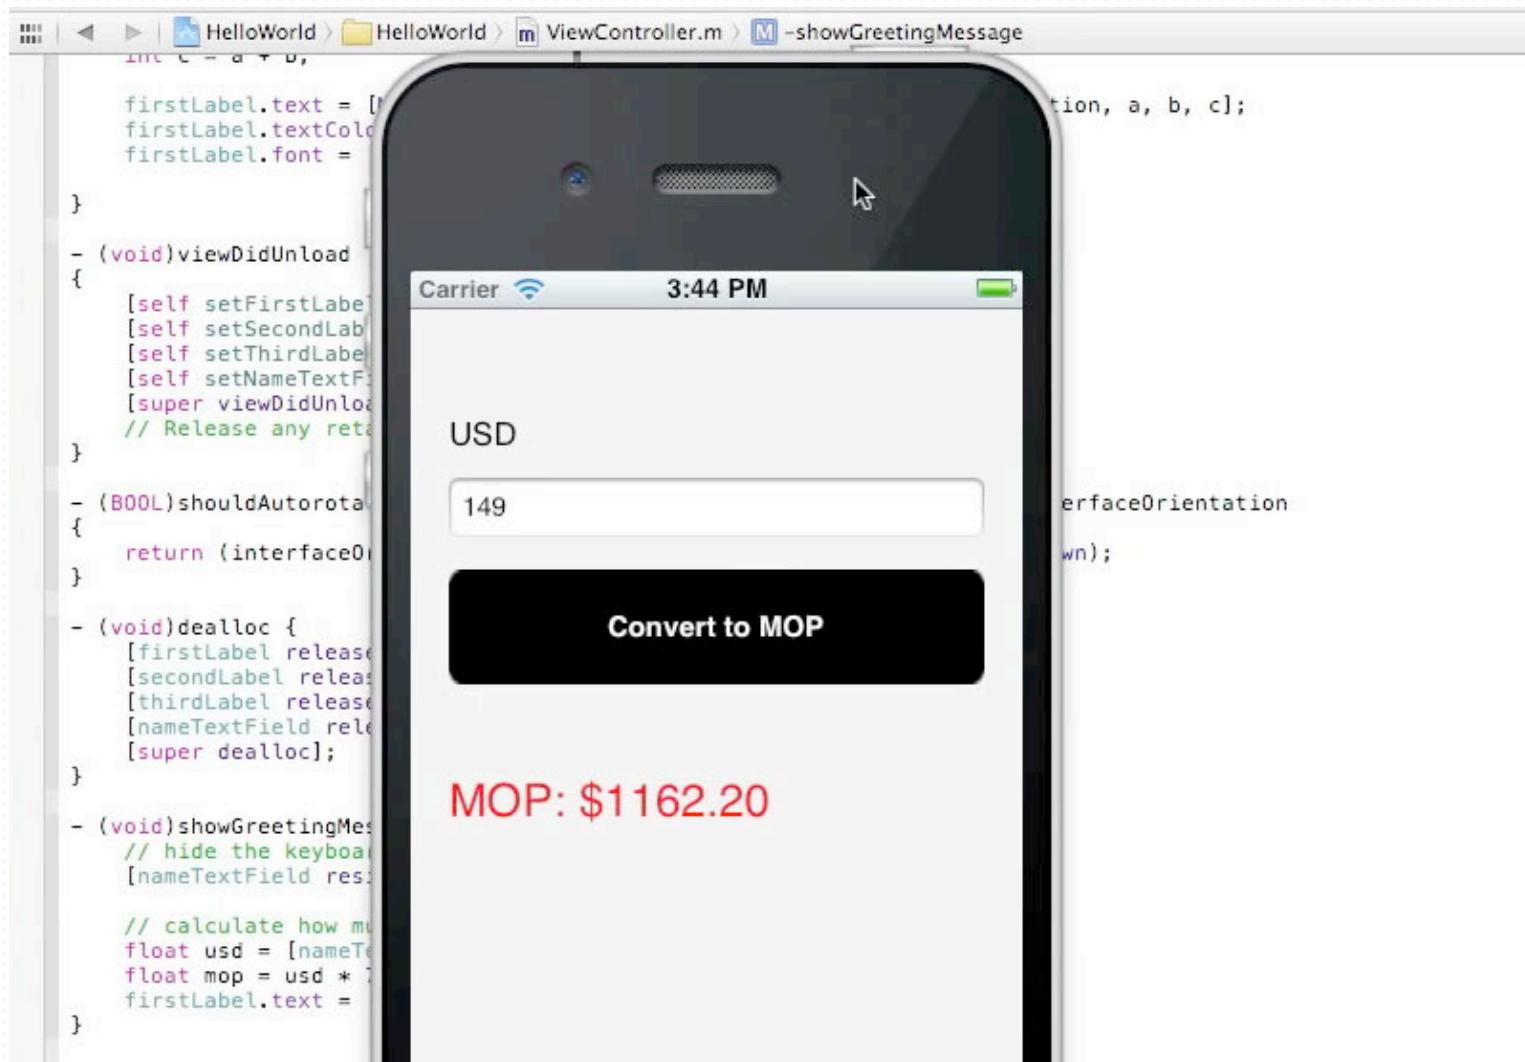

And we may want to make the button bigger.

# Using UIButton

```
1 - (void)showGreetingMessage {
2     // hide the keyboard.
3     [self.nameTextField resignFirstResponder];
4
5     // calculate how much is the MOP
6     float usd = [self.nameTextField.text floatValue];
7     float mop = usd * 7.8;
8     self.firstLabel.text = [NSString stringWithFormat:@"MOP:
$%0.2f", mop];
9 }
```

We add some calculation logic when tap the button.

# Using UIButton

Finally, let's test the app in simulator.

# Exercise

- ✓ Design an utility app.
- ✓ Present it to the class in next lesson.
